XtTranslateCoords − translate widget coordinates

void XtTranslateCoords(*w***,** *x***,** *y***,** *rootx_return***,** *rooty_return***)**
    Widget *w***;**
    Position *x***,** *y***;**
    Position **rootx_return***, ****rooty_return***;**

rootx_return
rooty_return   Returns the root-relative x and y coordinates.

x
y   Specify the widget-relative x and y coordinates.

w   Specifies the widget.

While XtTranslateCoords is similar to the Xlib **XTranslateCoordinates** function, it does not generate a server request because all the required information already is in the widget's data structures.
