PERFORMANCE of IBM WEB SERVERS SYSTEMS

September 11, 2001

This is update of the September 4, 2001 Systems Performance Report. The TPC-C version 5 results for the IBM @server pSeries 660 Model 6M1 have been added.

Section One of this report includes the SPEC2000 and LINPACK results. The SPEC95 results are included in Section 1a.

Section Two is multi-user performance. The rPerf, SPEC_rate, and SPECweb99 are presented in this section.

Section Three presents the TPC-C version 5 results. The version 3 results are included in Section 3a. Starting April 20, 2001, TPC-C will not accept version 3 results. TPC-C version 3 results can not be compared to version 5 results.

Section Four, TPC-H results of an RS/6000 SP system with 32 375 MHz POWER3 SMP Wide Nodes and the 8, 12 and 16-quad NUMA-Q 2000 Model E410 systems are provided.

Section Five reflects the published NotesBench results to date for RS/6000 systems including the M80 NotesBench Version 5 result.

Section Six reflects the published SPECjvm98 and SPECjbb2000 Java benchmarks.

Sections Seven through Eleven include published application performance benchmarks for SAP, PeopleSoft, Oracle Applications, Baan, J.D.Edwards and VolanoMark (Java).

Section Twelve is a historical list of Relative OLTP estimates for IBM RS/6000 models and IBM RS/6000 SP nodes that have been withdrawn from marketing. IBM has discontinued Relative OLTP results.

All performance measurements for the IBM @server pSeries and IBM RS/6000 systems were made with systems running the AIX operating system. For new and upgraded systems, AIX Version 4.3 or AIX 5L Version 5.1 were used. All other systems used previous versions of AIX. All performance measurements for the NUMA-Q systems were made with the systems running the ptx operating system.

POWER3 T/W			POWER3	200	2	21.0
POWER3 H	1999/09/13	2000/12/29	POWER3	222	2	23.0
POWER3 H			POWER3	222	4	43.3
POWER3 H			POWER3	222	6	64.0
POWER3 H			POWER3	222	8	81.3

Note: The Relative OLTP projections are based on different levels of AIX and databases. As a result, actual performance may vary. Estimates have been provided where no historical projections were available.

=====

* - New from September 4, 2001 version

- These systems have been withdrawn from marketing or announced to be withdrawn from marketing and are included for historical purposes.

P2SC - POWER2 Super Chip; P3 - POWER3 ; P3-II - POWER3-II ; T/W - Thin or Wide SP node

NOTES ON PERFORMANCE BENCHMARKS AND VALUES

The performance benchmarks and the values shown here were derived using particular, well configured, development-level computer systems. Unless otherwise indicated for a system, the values were derived using 32-bit applications and external cache if external cache is supported on the system. All performance benchmark values are provided "AS IS" and no warranties or guarantees are expressed or implied by IBM. Actual system performance may vary and is dependent upon many factors including system hardware configuration and software design and configuration. Buyers should consult other sources of information to evaluate the performance of systems they are considering buying and should consider conducting application oriented testing. For additional information about the performance benchmarks, values and systems tested, please contact your IBM local Branch Office or IBM Authorized Reseller or access the following on the Web:

- | | | |
|---------|---|---|
| SPEC | - | http://www.spec.org |
| TPC | - | http://www.tpc.org |
| LINPACK | - | http://www.netlib.no/netlib/benchmark/performance.ps |

Unless otherwise indicated for a system, the performance benchmarks were conducted using AIX v 4.2 ,v 4.3 or v5.1. IBM C for AIX v 3.6.4.0 and XL Fortran v 6.1.0.0 and v 7.1.0.0 were the compilers used in the benchmark tests. The preprocessors used in the benchmark tests include KAP 3.2 for Fortran and KAP/C 1.4.2 from Kuck & Associates and VAST-2 v 4.01X8 from Pacific-Sierra Research. The preprocessors were purchased separately from these vendors.

The following SPEC and LINPACK benchmarks reflect the performance of the microprocessor, memory architecture and compiler of the tested system:

SPECint95 - SPEC component-level benchmark that measures integer performance. Result is the geometric mean of eight tests that comprise the CINT95 benchmark suite. All of these are written in C language.

SPECint_base95 is the result of the same tests in CINT95 with a maximum of four compiler flags that must be used in all eight tests.

SPECint_rate95 - Geometric average of the eight SPEC rates from the SPEC integer tests (CINT95).

SPECint_base_rate95 is the result of the same tests as CINT95 with a maximum of four compiler flags that must be used in all eight tests.

SPECfp95 - SPEC component-level benchmark that measures floating-point performance. Result is the geometric mean of ten tests, all written in FORTRAN, that are included in the CFP95 benchmark suite.

SPECfp_base95 is the result of the same tests in CFP95 with a maximum of four compiler flags that must be used in all ten tests.

SPECfp_rate95 - Geometric average of the ten SPEC rates from SPEC floating-point tests (CFP95).

SPEC_base_rate95 is the result of the same tests as CFP95 with a maximum of four compiler flags that must be used in all ten tests.

SPECint2000 - New SPEC component-level benchmark that measures integer performance. Result is the geometric mean of twelve tests that comprise the CINT2000 benchmark suite. All of these are written in C language except for one which is in C++.

SPECint_base2000 is the result of the same tests in CINT2000 with a maximum of four compiler options that must be used in all twelve tests.

SPECint_rate2000 - Geometric average of the twelve SPEC rates from the SPEC integer tests (CINT2000).

SPECint_rate_base2000 is the result of the same tests as CINT2000 with a maximum of four compiler options that must be used in all twelve tests.

SPECfp2000 - New SPEC component-level benchmark that measures floating-point performance. Result is the geometric mean of fourteen tests, all written in FORTRAN and C languages, that are included in the CFP2000 benchmark suite.

SPECfp_base2000 is the result of the same tests in CFP2000 with a maximum of four compiler options that must be used in all fourteen tests.

SPECfp_rate2000 - Geometric average of the fourteen SPEC rates from SPEC floating-point tests (CFP2000).

SPECfp_rate_base2000 is the result of the same tests as CFP2000 with a maximum of four compiler options that must be used in all fourteen tests.

SPECweb96 - Maximum number of Hypertext Transfer Protocol (HTTP) operations per second achieved on the SPECweb96 benchmark without significant degradation of response time. The Web server software is IBM HTTP Server or ZEUS from Zeus Technology Ltd.

SPECweb99 - Number of conforming, simultaneous connections the Web server can support using a predefined workload. The SPECweb99 test harness emulates clients sending the HTTP requests in the workload over slow Internet connections to the Web server. The Web server software is Zeus from Zeus Technology Ltd.

SPECjvm99 - The SPECjvm98 benchmark suite contains eight different tests. Each test measures the time it takes to load the program, verify the class files, compile on the fly if a JIT compiler is used, and execute the test. A geometric mean is used to compute the a composite score. Test scores are normalized against a reference machine. Higher scores indicate better performance.

SPECjbb2000 - Expressed in operations per second. SPECjbb2000 represents an order processing application for a wholesale supplier. It is implemented as a Java program emulating a three-tier client/server system with emphasis on the middle tier.

LINPACK DP (Double Precision) - n=100 data array. Units are Megaflops.

LINPACK SP (Single Precision) - n=100 data array. Units are Megaflops.

LINPACK TPP (Toward Peak Performance) - n=1,000 data array. Units are Megaflops. ESSL Version 3.1.1 or 3.1.2 was used in this test.

The following Transaction Processing Council (TPC) benchmarks reflect the performance of the microprocessor, memory subsystem, disk subsystem and some portions of the network:

tpmC - TPC Benchmark C throughput measured as the average number of transactions processed per minute during a valid TPC-C configuration run of at least twenty minutes.

\$/tpmC - TPC Benchmark C price-performance ratio reflects the estimated five year total cost of ownership for system hardware, software and maintenance and is determined by dividing such estimated total cost by the tpmC for the system.

QppH is the power metric of TPC-H and is based on a geometric mean of the 17 TPC-H queries, the insert test and the delete test. It measures the ability of the system to give a single user the best possible response time by harnessing all available resources. QppH is scaled based on database size from 30GB to 1TB.

QthH is the throughput metric of TPC-H and is a classical throughput measure characterizing the ability of the system to support a multiuser workload in a balanced way. A number of query users is chosen, each of which must execute the full set of 17 queries in a different order. In the background, there is an update stream that runs a series of insert/delete operations. QthH is scaled based on the database size from 30GB to 1TB.

QphH is the geometric mean of the power tests (QppH) and the throughput tests (QthH).

\$/QphH is the price/performance metric for the TPC-H benchmark where QphH is the geometric mean of QppH and QthH. The price is the five year cost of ownership for the tested configuration and includes maintenance and software support.

NotesBench is the driver program to test various aspects of Lotus Notes. It is designed to execute the commands in customized workload scripts, simulating Notes client actions. Notesbench tests include "mail only", "mail and database". All IBM results have been published with the "mail only" workload.

Total Users - number of active users supported in the workload, each producing approximately one transaction/minute.

TPM - transactions per minute (NotesMark)

Average Response Time - average time for a transaction to be completed for an average user action.

\$/User - Total cost of the hardware and software including discounts quoted by a supplier.

NOTES ON PERFORMANCE ESTIMATES

The rPerf (Relative Performance) is an estimate of commercial processing performance. It is derived from an IBM analytical model which uses characteristics from IBM internal workloads, TPC and SPEC benchmarks. The rPerf model is not intended to represent any specific public benchmark results and should not be reasonably used in that way. The model simulates some of the system operations such as CPU, cache and memory. However, the model does not simulate disk or network I/O operations. Although the model uses general database and operating system parameters, it does not reflect specific database or AIX version or releases. Unless otherwise indicated, the model assumes the use of 32-bit applications.

Unless otherwise indicated, rPerf is estimated only at the time a system is introduced. The IBM @server pSeries Model B80 is the baseline reference system and has a value of 1.0. Although rPerf may be used to compare estimated IBM UNIX commercial processing performance, actual system performance may vary and is dependent upon many factors including system hardware configuration and software design and configuration. IBM withdrew Relative OLTP (ROLTP). Starting June 2001, IBM will not publish/update ROLTP results. ROLTP results of systems that are withdrawn from the market are left in Section 12, Historical Multiuser Performance.

APPLICATION BENCHMARKS

SAP - Benchmark overview information: www.sap-ag.de/solutions/technology/bench.htm
Benchmark White Paper September, 2000; www.sap-ag.de/solutions/technology/pdf/50020428.pdf

PEOPLESOFT - To get information on PeopleSoft benchmarks, contact PeopleSoft directly or the PeopleSoft/IBM International Competency Center in San Mateo, CA.

ORACLE Applications - Benchmark overview information: www.oracle.com/apps_benchmark/

BAAN - The Baan benchmark demonstrates the scalability of Baan ERP solutions. The test results provide the number of Baan Reference Users (BRUs) that can be supported on a specific system. BRU is a single on-line user or a batch unit workload. These metrics are consistent with those used internally by both IBM and Baan to size systems.

To get information on Baan benchmarks contact Baan directly or the IBM/Baan International Competency Center San Mateo, CA.

VOLANOMARK - VolanoMark is a 100% Pure Java server benchmark characterized by long-lasting network connections and high thread counts. In this context, long-lasting means the connections last several minutes or longer, rather than just a few seconds. The VolanoMark benchmark creates client connections in groups of 20 and measures how long it takes for the clients to take turns broadcasting their messages to the group. At the end of the test, it reports a score as the average number of messages transferred by the server per second. For additional information: www.volano.com
