IBM Netfinity Servers

IBM Netfinity 7000-M10 - Type 8680
Models 1RU, 2RU, 3RU, 4RU,
5RU, 6RY, 7RY, 8RY, 1SY, 2SY, 3SY, 11Y, 21Y

Hardware Maintenance Manual

August 1999

We Want Your Comments!
(Please see page 265)
Before using this information and the product it supports, be sure to read the general information under "Notices" on page 269.

Third Edition (August 1999)

The following paragraph does not apply to the United Kingdom or any country where such provisions are inconsistent with local law: INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This publication could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time.

This publication was developed for products and services offered in the United States of America. IBM may not offer the products, services, or features discussed in this document in other countries, and the information is subject to change without notice. Consult your local IBM representative for information on the products, services, and features available in your area.

Requests for technical information about IBM products should be made to your IBM reseller or IBM marketing representative.

About This Manual

This manual contains diagnostic information, a Symptom-to-FRU Index, service information, error codes, error messages, and configuration information for the Netfinity 7000-M10 - Type 8680.

Important

This manual is intended for trained servicers who are familiar with IBM PC Server products.

Important Safety Information

Be sure to read all caution and danger statements in this book before performing any of the instructions.

Leia todas as instruções de cuidado e perigo antes de executar qualquer operação.

注意和危险声明（简体中文）

重要内容：

本书中的所有注意和危险声明之前都有编号。该编号用于翻译成中文和英文的注意或危险声明。例如，如果一个注意声明以编号 1 开始，那么对该注意声明的翻译出现在 Safety Information 一书中的声明 1 中。

在执行任何操作前，请务必阅读所有注意和危险声明。

注意及危險聲明（中文）

重要資訊：

本書中的所有「注意」及「危險」聲明均以數字開始。此數字可作為參考對應的安全聲明。例如，「注意」或「危險」聲明可在 Safety Information 一書中找到相同內容的「注意」或「危險」聲明。

例如，有一「危險」聲明以數字 1 開始，則該「危險」聲明的譯文亦出現在 Safety Information 一書的「聲明」1 中。

執行動作前，請詳閱所有「注意」及「危險」的聲明。

Prenez connaissance de toutes les consignes de type Attention et Danger avant de procéder aux opérations décrites par les instructions.

Lesen Sie alle Sicherheitshinweise, bevor Sie eine Anweisung ausführen.
Online Support

Use the World Wide Web (WWW) or the IBM PC Company BBS to download Diagnostic, BIOS Flash, and Device Driver files.

General Checkout

The server diagnostic programs are stored in nonvolatile random-access memory (NVRAM) on the I/O board. These programs are the primary method of testing the major components of your server: the I/O board, Ethernet controller, video controller, RAM, keyboard, mouse (pointing device), diskette drive, serial port, and parallel port. You can also use them to test some external devices.

Also, if you cannot determine whether a problem is caused by the hardware or by the software, you can run the diagnostic programs to confirm that the hardware is working properly.

When you run the diagnostic programs, a single problem might cause several error messages. When this occurs, work to correct the cause of the first error message. After the cause of the first error message is corrected, the other error messages might not occur the next time you run the test.

A failed system might be part of a shared DASD cluster (two or more systems sharing the same external storage device(s)). Prior to running diagnostics, verify that the failing system is not part of a shared DASD cluster.

A system might be part of a cluster if:

- The customer identifies the system as part of a cluster.
- One or more external storage units are attached to the system and at least one of the attached storage units is additionally attached to another system or unidentifiable source.
- One or more systems are located near the failing system.

If the failing system is suspect to be part of a shared DASD cluster, all diagnostic tests can be run except diagnostic tests which tests the storage unit (DASD residing in the storage unit) or the storage adapter attached to the storage unit.
Notes

1. Fan(s) not running or running fast, see “Error Symptoms” on page 192.
2. For systems that are part of a shared DASD cluster, run one test at a time in looped mode. Do not run all tests in looped mode, as this could enable the DASD diagnostic tests.
3. If an error is displayed on the front panel, see “System Management Codes” on page 208.
4. If multiple error codes are displayed, diagnose the first error code displayed.
5. If the computer hangs with a POST error, go to the “Symptom-to-FRU Index” on page 182.
6. If the computer hangs and no error is displayed, go to “Undetermined Problems” on page 205.
7. Intermittent problems, check the system error log; see, “Error Logs” on page 34.
8. Power Supply problems, see “Power Supply LED Errors” on page 194.
9. Safety information, see “Safety Information” on page 226.

001
IS THE SYSTEM PART OF A CLUSTER?
Yes  No

Go to Step 004.

002

Schedule maintenance with the customer. Shut down all failing systems related to the cluster. Run storage test.

003

004

- Power-off the computer and all external devices.
- Check all cables and power cords.
- Set all display controls to the middle position.
- Power-on all external devices.
- Power-on the computer.
- Check the front panel system error LED; if blinking, check the error message on the front panel and see “System Management Codes” on page 208.
- Check the system error log. If an error was recorded by the system, see “Symptom-to-FRU Index” on page 182.
- Start the Diagnostic Programs. See “Running Diagnostic Programs” on page 12.

(Step 004 continues)
004 (continued)

– Check for the following responses:
  1. No beep.
  2. Readable instructions or the Main Menu.

DID YOU RECEIVE THE CORRECT RESPONSES?
Yes  No

005

Find the failure symptom in “Symptom-to-FRU Index” on page 182.

006

– Run the Diagnostic Programs. If necessary, refer to “Running Diagnostic Programs” on page 12.
  • If you receive an error, go to “Symptom-to-FRU Index” on page 182.
  • If the diagnostics completed successfully and you still suspect a problem, go to “Undetermined Problems” on page 205.
Diagnostics

Server problems can be caused by hardware, software, or a user error. An example of a user error is pressing the wrong key on the keyboard.

The following tools are available to help identify and resolve hardware-related problems:

- Diagnostic programs
- Power-on self-test (POST)
- POST beep codes
- Error messages
- Troubleshooting charts
- System error log
- Option diskettes

Diagnostic Programs: The server diagnostic programs are stored on electrically erasable programmable read-only memory (EEPROM). These programs are the primary method of testing the major components of your server and some external devices.

Also, if you cannot determine whether a problem is caused by the hardware or by the software, you can run the diagnostic programs to confirm that the hardware is working properly.

---

Note

When you run the diagnostic programs, a single problem might cause several error messages. When this occurs, work to correct the cause of the first error message. After the cause of the first error message is corrected, the other error messages might not occur the next time you run the test.

---

Power-On Self Test (POST): When you turn on the server, it performs a series of tests to check the operation of server components and some of the options installed in the server. This series of tests is called the power-on self-test or POST.

POST does the following:

- Checks the operation of some basic I/O function card, processor board, and I/O board operations
- Checks the memory
- Compares the current server configuration with the stored server configuration information
- Configures PCI adapters
- Starts the video operation
- Verifies that drives (such as the diskette, CD-ROM, and hard disk drives) are connected properly
If you have a power-on password or administrator password set, you must type the password and press Enter before POST will continue.

If POST finishes without detecting any problems, a single beep sounds and the first screen of your operating system or application program appears.

If POST detects a problem, more than one beep sounds and an error message appears on your screen.

---

**Note**
A single problem might cause several error messages. When this occurs, work to correct the cause of the first error message. After the cause of the first error message is corrected, the other error messages usually will not occur the next time you run the test.

---

**POST Beep Codes:** POST generates beep codes to indicate successful completion or the detection of a problem.

- One beep indicates the successful completion of POST.
- More than one beep indicates that POST detected a problem. For more information, see “Beep Symptoms” on page 182.

**Error Messages:** Error messages indicate that a problem exists; they are not intended to be used to identify a failing part. Troubleshooting and servicing of complex problems indicated by error messages should be performed by trained service personnel.

Hardware error messages that occur can be text, numeric, or both. Messages generated by your software generally are text messages, but they also can be numeric.

**POST Error Messages:** POST error messages occur during startup when POST finds a problem with the hardware or detects a change in the hardware configuration. For a list of POST errors, see “POST Error Codes” on page 195.

**System Monitoring Messages:** System monitoring messages occur as the Advanced Remote Management Controller monitors critical system functions. For a list of codes, see “System Management Codes” on page 208.

**Diagnostic Error Messages:** Diagnostic error messages occur when a test finds a problem with the server hardware. These error messages are alphanumeric and they are saved in the Test Log. For a list of diagnostic error codes, see “Diagnostic Error Codes” on page 187.
Software-Generated Error Messages: These messages occur if a problem or conflict is found by an application program, the operating system, or both. Messages are generally text messages, but they also can be numeric. For information about these error messages, refer to the documentation that comes with your software.

System Error Log: The system error log contains all error and warning messages issued during POST and all system status messages from the Advanced Remote Management Controller (system management adapter). See “System Error Log” on page 34 for information about how to view the system error log.

Option Diskettes: An optional device or adapter can come with an Option Diskette. Option Diskettes usually contain option-specific diagnostic test programs or configuration files.

If your optional device or adapter comes with an Option Diskette, follow the instructions that come with the option. Different instructions apply depending on whether the Option Diskette is startable or not.
Diagnostic Programs
This section includes useful information about running the diagnostic programs. These programs are designed to test the IBM Netfinity 7000-M10. If you want to test a non-IBM product, refer to the information that comes with that product.

Notes
1. When you run the diagnostic programs, a single problem might cause several error messages. When this occurs, work to correct the cause of the first error message. After the cause of the first error message is corrected, the other error messages usually will not occur the next time you run the test.
2. You can also run the diagnostic programs remotely with the Advanced Remote Management Controller in conjunction with the Advanced System Management service capabilities of Netfinity Manager, a terminal program, or a web browser. Refer to the “Advanced Remote Management Reference” section of this Server Library for more information.

Running Diagnostic Programs: While you are running the diagnostic programs, pressing F1 displays help information. Pressing F1 from within a help screen provides a help index from which you can select different categories. Pressing Esc closes the Help window and returns to running the diagnostic programs.
Notes

1. To run the diagnostic programs, you must start the server with the highest level password. That is, if you enter the power-on password and an administrator password is set, you cannot run the programs. You can only view the error messages in the Test Log. You must enter the administrator password to run the diagnostic programs.

2. If the server stops during testing and you cannot continue, restart the server and try running the diagnostic programs again. If the system hangs while running memory tests, press the reset button 3 times waiting five seconds between each reset. This procedure tells BIOS to disable memory performance enhancements for a more accurate memory test. Press F2 to select diagnostics. An 062 error will occur on the third reset; exit Setup and the diagnostics will load. Run the memory test again.

3. If the diagnostic tests do not find a problem but the problem persists during normal operations, go to “Undetermined Problems” on page 205.

4. You might have to install a wrap connector on your active parallel or serial port to obtain accurate test results for these ports. If you do not have a wrap connector, contact your IBM reseller or IBM marketing representative.

5. You might need a scratch diskette to obtain accurate test results when testing the diskette drive.

6. The keyboard and mouse (pointing device) tests assume that a keyboard and mouse are attached to the server.

To start the diagnostic programs:

1. Turn on the server and watch the screen. If the server is turned on already, shut down your operating system and restart the server.

2. When the message F2 for Diagnostics appears, press F2. If a power-on password or administrator password is set, the server prompts you for it. Type in the appropriate password; then, press Enter. The Diagnostic Programs screen appears.

3. Select either Extended or Basic from the top of the screen.

4. Select the test you want to run from the list that appears; then, follow the instructions on the screen.
When the tests have completed, you can view the Test Log by selecting **Utility** from the top of the screen.

Also, you can view server configuration information (such as system configuration, memory contents, interrupt request (IRQ) use, direct memory access (DMA) use, device drivers, and so on) by selecting **Hardware Info** from the top of the screen.

If the hardware checks out OK but the problem persists during normal server operations, a software error might be the cause. If you suspect a software problem, refer to the information that comes with the software package.

**Viewing the Test Log:** If you are already running the diagnostic programs, continue with step 3 in this procedure.

**To view the Test Log:**

1. Turn on the server and watch the screen.
   
   If the server is turned on already, shut down your operating system and restart the server.

2. When the message **F2 for Diagnostics** appears, press **F2**.

   If a power-on password or administrator password is set, the server prompts you for it. Type in the appropriate password; then, press **Enter**.

   The Diagnostic Programs screen appears.

3. Select **Utility** from the top of the screen.

4. Select **View Test Log** from the list that appears; then, follow instructions on the screen.

**Note**

The diagnostic test log will not contain results from previous diagnostic runs. The results can be saved to a disk.
Resolving Configuration Conflicts
The Configuration/Setup Utility program configures only the server hardware. It does not consider the requirements of the operating system or the application programs. For these reasons, memory-address configuration conflicts might occur.

Changing the Software Configuration
Setup: The best way to resolve memory-address conflicts is to change the software configuration by changing the addresses that the EMS device driver defined. The SVGA video memory occupies 32 Kb (1 Kb = approximately 1000 bits) of space in the hex C0000 to C7FFF EMS memory area. EMS device drivers must use addresses different from those assigned to video read-only memory (ROM). You can use the Configuration/Setup Utility program to view or change the current setting for video ROM. For information about using the Configuration/Setup Utility program, see “Using the Configuration/Setup Utility Main Menu” on page 26.

Changing the Hardware Configuration
Setup: An alternative way to resolve memory-address conflicts is to change the address of the conflicting hardware option.
Identifying Problems through Status Indicators

Your server has status indicators to help you identify problems with some server components. Status indicators are located on the following components:

- Hard disk drive trays
  For more information, see “Controls and Indicators” on page 109.
- Power supplies
  For more information, see “Power Supply LEDs” on page 17.
- I/O board
  For more information, see “Installing a Hot-Plug PCI Adapter” on page 176.
- Front panel
  For more information, see “Information LED Panel” on page 120.
- Rear panel
  For more information, see “Input/Output Connectors and Expansion Slots” on page 121.
**Power Supply LEDs:** The AC and DC Power LEDs on the power supplies provide status information about the power supplies. See “Hot-Swap Power Supplies” on page 114 for the location of the LEDs.

The following table describes the AC and DC Power LEDs.

<table>
<thead>
<tr>
<th>AC Power LED</th>
<th>DC Power LED</th>
<th>Description and Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>On</td>
<td>On</td>
<td>The power supply is on and operating correctly.</td>
</tr>
</tbody>
</table>
| On           | Off          | There is a DC power problem. Possible causes:  
1. The Power Control button on the front of the server is in the Off position (the DC Power LEDs on all the power supplies are off).  
Action: Press the Power Control button to start the server.  
2. The Power switch on the power supply is in the Off position.  
Action: Turn the Power switch to the On position.  
3. The power supply has failed (the DC Power LED on at least one of the power supplies is on).  
Action: Replace the power supply.  
If the problem persists, go to “Undetermined Problems” on page 205. |
| Off          | Off          | There is an AC power problem. Possible causes:  
1. There is no AC power to the power supply.  
Action: Verify that:  
• The power cord is properly connected to the server.  
• The power outlet functions properly.  
2. The power supply has failed.  
Action: Replace the power supply.  
If the problem persists, go to “Undetermined Problems” on page 205. |
System Component Status Indicators:

Status indicators on the I/O board, processor board, memory board, and the Advanced Remote Management Controller can help identify problems. The indicators are lit during POST to ensure the indicators operate. After POST completes, the indicators show the status of the component.

For the location of the status indicators, see:
- “Processor Board Component Locations” on page 165.
- “Memory Board Component Locations” on page 147.
- “I/O Board Component Locations” on page 142.
- “I/O Board LEDs” on page 143.
- “Advanced System Management PCI Adapter Component Locations” on page 88.

### Processor Board LEDs

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microprocessor Bus Activity LED</td>
<td>If activity on the microprocessor bus is present, the indicator for the slot is lit.</td>
</tr>
<tr>
<td>Microprocessor VRM Status LED</td>
<td>If a VRM or processor fails or is missing, the LED will light.</td>
</tr>
<tr>
<td>Microprocessor Termination LED</td>
<td>If proper termination of the microprocessor slot 4 is present, the indicator is lit.</td>
</tr>
<tr>
<td>ERR 0 and ERR 1 LEDs</td>
<td>If either LED is on, see “Symptom-to-FRU Index” on page 182 for an explanation.</td>
</tr>
</tbody>
</table>

### Memory Board LED

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Memory Module Status LED</td>
<td>If a memory module is present and has failed, the indicator for the slot is lit.</td>
</tr>
</tbody>
</table>

### I/O Board LEDs

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power On LED</td>
<td>If power to a PCI slot is present, the indicator for the slot is lit.</td>
</tr>
<tr>
<td>Attention LED</td>
<td>Your operating system defines the meaning of this indicator. Refer to your operating system documentation for more information.</td>
</tr>
</tbody>
</table>

For additional I/O Board LEDs, see “I/O Board LEDs” on page 143.
**Advanced Remote Management Controller LEDs**

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power On LED</td>
<td>If power to the Advanced Remote Management Controller is present, the indicator is lit.</td>
</tr>
<tr>
<td>Processor Error LED</td>
<td>If the processor on the Advanced Remote Management Controller has failed, the indicator is lit.</td>
</tr>
<tr>
<td>Ethernet Activity LED</td>
<td>If the Ethernet controller on the Advanced Remote Management Controller is transmitting data or receiving data, the indicator is lit.</td>
</tr>
<tr>
<td>Ethernet Link LED</td>
<td>If an active link to the Ethernet controller on the Advanced Remote Management Controller is present, the indicator is lit.</td>
</tr>
</tbody>
</table>
Features at a Glance

The following list summarizes the features of the Netfinity 7000-M10 - Type 8680.

Microprocessor
- Intel® Pentium® II Xeon™ microprocessor with MMX™ technology
- 16 KB of level-1 cache
- 512 KB of level-2 cache (min.)
- Expandable to four microprocessors

Memory
- 128 MB (min.) of system memory, expandable to 8 GB
- 50 ns, buffered, extended data output (EDO), error correcting code (ECC)
- Maximum of 32 dual inline memory-module (DIMM) sockets on two memory boards

Diskette Drive
- Standard: One 3.5-inch, 1.44 MB

Hard Disk Drives
- Up to four hot-swap hard disk drives supported

CD-ROM Drive
- Standard: Enhanced IDE

Redundant Cooling
- Four hot-swap fans

Information Panel
- Two 16-character lines of status information

Expansion Slots
- Five 64-bit hot-plug PCI slots
- Seven 32-bit hot-plug PCI slots

Expansion Bays
- Four slim-high (1-inch) or two half-high (1.6-inch) hot-swap drive bays
- One 5.25-inch removable-media bay (CD-ROM drive preinstalled)

Upgradable Microcode
- BIOS, diagnostics, and system-management processor upgrades (when available) can update EEPROM
Security Features
- Power-on and administrator passwords
- Mountable in an optional secure rack enclosure
- Selectable drive-startup
- Keyboard password
- Netfinity Advanced Remote Management Controller security:
  - User log-in password
  - Read-only or read/write access
  - Dial back

Integrated Functions
- LED usability support
- Two serial ports
- Two universal serial bus (USB) ports
- One parallel port
- Mouse and keyboard ports
- Netfinity Advanced Remote Management Controller
- Two UltraSCSI connectors
- Video controller port compatible with:
  - Super video graphics array (SVGA)
  - Video graphics adapter (VGA)
  - 1 MB video memory

Power Supply
- 400 W (115–230 V ac)
- Automatic voltage-range selection
- Built-in overload and surge protection
- Automatic restart after a loss of power
- Redundant power available with optional power supply

Predictive Failure Analysis (PFA) Alerts
- Fans
- Power Supplies
- Memory
- Hard disk drives
- Microprocessors
Additional Service Information

The following additional service information supports the Netfinity 7000-M10 - Type 8680.

• “Configuration Overview” on page 23.
• “The Configuration/Setup Utility Program” on page 25.
• “Using the Configuration/Setup Utility Main Menu” on page 26.
• “Configuring Options” on page 35.
• “Resolving Configuration Conflicts” on page 36.
• “Using the SCSISelect Utility” on page 38.
• “Advanced System Management” on page 44.
• “Netfinity Advanced System Management Token Ring Connection Option” on page 80.
• “System Reliability Considerations” on page 82.
• “Specifications” on page 84.
Configuration Overview
You play a key role in how the server allocates resources to organize and interconnect hardware devices and software programs. This allocation process is referred to as configuration. The steps required to configure the server depend on the number and types of devices and programs that you install.

The server supports PCI adapters and SCSI devices. Because of this flexibility, you can choose from among many adapters and devices.

In general, the greater the number and variety of hardware devices and software programs that you install in the server, the more you will have to interact with the server and the devices to correctly configure the system.

The server comes with the following hardware configuration programs:

- Configuration/Setup Utility
  With the built-in Configuration/Setup Utility program, you can configure I/O functions, such as serial and parallel port assignments; change interrupt request (IRQ) settings; and change the startup sequence for drives that you install. You also can use this program to set passwords for starting up the server and accessing the Configuration/Setup Utility program.

- SCSISelect Utility
  With the built-in SCSISelect Utility, you can configure the SCSI devices that you attach to the SCSI controller. You can use SCSISelect to change default values, resolve configuration conflicts, and perform a low-level format on a SCSI hard disk drive.
Before installing a new device or program, read the documentation that comes with it. Reading the instructions helps you to determine the steps required for installation and configuration. The following actions are typically, but not always, required to configure the server.

1. Run the Configuration/Setup Utility program and record the current configuration settings.
2. Set jumpers or switches on server components.
   - See “Changing Jumper Positions” on page 93 and “I/O Function Card Jumpers” on page 146.
3. Set jumpers or switches on the device.
   - See the device installation instructions.
4. Install the device in the server.
   - See “Locations” on page 86.
5. Install software programs.
   - See the installation instructions that come with the software.
6. Resolve configuration conflicts.
   - See “Resolving Configuration Conflicts” on page 36.
The Configuration/Setup Utility Program

For most configurations, the server will operate using the default system settings. You need to change the settings only to resolve configuration conflicts or to enable or change device functions (for example, defining diskette types, and so on).

When you want or need to change the default settings, the Configuration/Setup Utility program provides a convenient way to display and change the settings.

After you run and exit from the Configuration/Setup Utility program, configuration information is stored in electrically erasable programmable read-only memory (EEPROM). While the server is off, the configuration information remains available for the next system startup.

Always run the Configuration/Setup Utility program if you add, remove, or relocate any hardware option, or if you receive an error message instructing you to do so. Review this information the information that comes with the option before making changes. Also, record the current settings before making any changes.

To start the Configuration/Setup Utility program:

1. Turn on the server and watch the screen.
2. When the message Press F1 for Configuration/Setup appears, press F1.

   **Note**
   
   If you enter the power-on password and an administrator (supervisor-level) password is also set, a limited version of the menu appears. To see the full menu, you must restart the server and enter the administrator password when you are prompted to enter a password. See “System Security” on page 28 for additional information.

The Configuration/Setup Utility main menu appears. For information about the menu, see “Using the Configuration/Setup Utility Main Menu” on page 26.

   **Note**
   
   When the message Press F2 for Diagnostics appears, press F2 to run the diagnostics programs. For information about running the diagnostics programs, see “Diagnostic Programs” on page 12.
Using the Configuration/Setup Utility

Main Menu

From the Configuration/Setup Utility main menu, you can select settings that you want to change. The Configuration/Setup Utility main menu is similar to the following screen.

Pressing F1 displays Help information for a selected menu item.

---

**Note**

The choices on some menus might differ slightly, depending on the BIOS version that comes with the server.

To change configuration settings:

1. Use the Up Arrow (↑) or Down Arrow (↓) key to highlight the menu item for the configuration setting that you want to change; then, press Enter.
2. Use the Up Arrow (↑) or Down Arrow (↓) key to choose the appropriate setting for the selected menu item; then, press Enter.
3. Repeat step 1 through step 2 for each setting that you want to change. Press Esc to return to the Configuration/Setup Utility main menu.
4. After making changes, you can select:
   - **Save Settings** to save the selected changes.
   - **Restore Settings** to delete the changes and restore the previous settings.
   - **Load Default Settings** to cancel the changes and restore the factory settings.
Note

The Configuration/Setup Utility main menu selections do not save settings, restore settings, or load default settings for the PCI Slot/Device Information choice. To save settings, or restore settings for the PCI Slot/Device Information choice, you must use the menu selections available from the PCI Slot/Device Information choice.

5. To exit from the Configuration/Setup Utility main menu, select Exit Setup. If you made any changes and did not save them with the Save Settings choice, the system prompts you to save or discard the changes when you attempt to exit from the Configuration/Setup Utility main menu.

System Summary: Select this choice to display configuration information, including the type and speed of the microprocessors and amount of memory.

Changes that you make to configuration settings appear on this summary screen. You cannot edit the fields.

The System Summary choice appears on the full Configuration/Setup Utility main menu and on the limited Configuration/Setup Utility main menu.

System Information: Select this choice to display information about the Netfinity 7000 M10. Changes that you make on other menus might appear on this summary screen. You cannot edit any fields. The System Information choice appears only on the full Configuration/Setup Utility main menu.

Product Data: Select this choice to view system information, such as the machine type and model, the system serial number, and the revision level or issue date of the BIOS stored on the flash electronically erasable programmable ROM (EEPROM).

System Card Data: Select this choice to view vital product data (VPD) for some server components.

Devices and I/O Ports: Software recognizes ports through their port assignments. Each port must have a unique port assignment. The Configuration/Setup Utility program normally handles this, but you might have special hardware or software that requires you to change these assignments.

Select the Devices and I/O Ports choice to view or change the assignments for devices and input/output ports.
You can add serial ports by installing a serial adapter in an expansion slot. See the documentation that comes with the serial adapter for information about port assignments.

You can configure the parallel port as bidirectional; that is, so that data can be both read from and written to a device. In bidirectional mode, the server supports Extended Capabilities Port (ECP) and Enhanced Parallel Port (EPP).

To display or change the assignments for devices, the serial ports, or parallel port:

1. Select Devices and I/O Ports.
2. Select a device or port; use the Left Arrow (←) or Right Arrow (→) key to advance through the settings.

   The Devices and I/O Ports choice appears only on the full Configuration/Setup Utility main menu.

Notes

1. When you configure the parallel port as bidirectional, use an IEEE 1284-compliant cable. The maximum length of the cable must not exceed 3 meters (9.8 feet).
2. The universal serial bus (USB) is configured automatically.
3. If you install a USB keyboard that has a mouse port, the USB keyboard emulates a mouse and you will not be able to disable the mouse settings in the Configuration/Setup Utility program.

Date and Time: Select this choice to set the system date and time.

   The system time is in a 24-hour format: hour:minute:second.

   The system date is in standard format for your country. For example, in the United States, the format is MM/DD/YYYY (Month/Day/Year).

   Select Date and Time; then, use the Left Arrow (←) or Right Arrow (→) key to advance through each data field.

   Type the new information; the system saves the information as you type it.

   The Date and Time choice appears only on the full Configuration/Setup Utility main menu.

System Security: To control access to the information in the server databases, you can implement two levels of password protection. Implementing these security measures helps you to ensure the integrity of the data and programs that are stored in the server.

After you set a power-on password, you can enable the unattended-start mode. This locks the keyboard and mouse, but allows the system to start the operating
The keyboard and mouse remain locked until you enter the correct password.

The System Security choice appears only on the full Configuration/Setup Utility main menu.

After you set a power-on or administrator password, you must enter the password when you turn on the server. (The passwords do not appear on the screen as you type them.)

<table>
<thead>
<tr>
<th>Type of Password</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>No password set</td>

</tbody>
</table>

Using the Power-On Password Menu: When a power-on password is set, you must enter a password each time that you start the system.

When a power-on password is set, POST does not complete until you enter the password. If you forget the power-on password, you can regain access to the server through one of the following methods:

- If an administrator password has been set, enter the administrator password at the power-on prompt. (If necessary, see “Using the Administrator Password Menu” on page 31 for details.) Start the Configuration/Setup Utility program and change the power-on password as previously described in this section (see steps 1 through 4 on page 30).
• You can change the position of the Password override jumper, as described in “Changing Jumper Positions” on page 93.
• You can remove the battery as described in “Battery” on page 89 and then install the battery.

To set a power-on password:
1. Select Power-on Password from the System Security menu; then, press Enter.
   The Power-on Password menu appears.
2. Type the password in the Enter Power-on Password data field.
   You can use any combination of up to seven characters (A–Z, a–z, and 0–9) for your power-on password. Keep a record of your password in a secure place.
3. Move the cursor to the Enter Power-on Password Again data field and type the password again.

   — Note —
   A message appears if the two passwords do not match. If this happens, press Esc to cancel the request and return to the System Security menu.

4. Select Change Power-on Password to save the new password; then, press Enter.

To delete a power-on password:
1. Select Power-on Password from the System Security menu; then, press Enter.
   The Power-on Password menu appears.
2. Select Delete Power-on Password; then, press Enter.
3. A confirmation window appears. Press Enter to delete the power-on password. Press Esc to cancel the request and return to the System Security menu.

To allow the system to start in unattended-start mode when a power-on password is set:
1. Select Power-on Password from the System Security menu; then, press Enter.
   The Power-on Password screen appears.
2. Select Allow for unattended boot with password.
   Press the Left Arrow (←) key or Right Arrow (→) key to toggle the entry to On.

   — Note —
   The Allow for unattended boot with password data field must be set to On for the system to support locally or remotely scheduled system shutdowns or restarts in unattended-start mode.
Using the Administrator Password Menu: The administrator password (sometimes called a supervisor-level password) controls access to some features of the server, including the Configuration/Setup Utility program.

Attention: If an administrator password is set and then forgotten, it cannot be overridden or removed. You must replace the I/O board.

To set an administrator password:
1. Select Administrator Password from the System Security menu; then, press Enter. The Administrator Password menu appears.
2. Type the password in the Enter Administrator Password data field.
   A password can contain any combination of up to seven alphanumeric characters (A–Z, a–z, and 0–9). Keep a record of your password in a secure place.
3. Move the cursor to the Enter Administrator Password Again data field and type the password again.
   Note: A message appears if the two passwords do not match. If this happens, press Esc to cancel the request and return to the System Security menu.
4. Select Change Administrator Password to save the new password; then, press Enter. The password becomes effective immediately.

To delete an administrator password:
1. Select Administrator Password from the System Security menu; then, press Enter. The Administrator Password menu appears.
2. Select Delete Administrator Password; then, press Enter.
3. A confirmation window appears. Press Enter to delete the administrator password. Press Esc to return to the System Security menu.

To enable a user to change the power-on password:
1. Select Administrator Password from the System Security menu; then, press Enter. The Administrator Password screen appears.
2. Select Power-on password changeable by user. Press the Left Arrow (←) or Right Arrow (→) key to toggle the entry to Yes.
When this choice is enabled, System Security appears on the limited Configuration/Setup Utility main menu. The
System Security menu contains the **Power-on Password** choice.

**Start Options:** Start options take effect when you start the server.

You can select keyboard operating characteristics, such as the keyboard speed. You also can specify whether the keyboard number lock starts on or off. You also can enable the server to run without a diskette drive or a monitor.

The server uses a startup sequence to determine the device from which the operating system loads. For example, you can define a startup sequence that checks for a startable diskette in the diskette drive, then checks the hard disk drive in bay 1, and then checks a network adapter.

**Attention:** If the CD-ROM drive contains a startable CD, you must remove the CD if you want to use a startup sequence that begins with a startable diskette.

You can enable a virus-detection test that checks for changes in the master boot record at startup. You also can choose to run POST in the enhanced mode or the quick mode.

Select **Start Options**; then, use the Left Arrow (←) or Right Arrow (→) key to advance through each data field.

The **Start Options** choice appears only on the full Configuration/Setup Utility main menu.

**Advanced Setup:** Select **Advanced Setup** to change values for advanced hardware features, such as cache control, and PCI configuration.

A warning message displays above the choices on this menu, to alert you that the system might malfunction if these options are configured incorrectly. Follow the instructions on the screen carefully.

Use the Left Arrow (←) or Right Arrow (→) key to scroll through each data field after you select one of the setup options.

The **Advanced Setup** choice appears only on the full Configuration/Setup Utility main menu.

**ACPI Control:** Select this choice to enable or disable the advanced configuration and power-management interface (ACPI) in the BIOS. You can choose to change the ACPI hardware signature or select an IRQ for ACPI. ACPI allows the operating system to place some server components into a reduced-power state during periods of low activity. You must have a BIOS level that supports ACPI to have this control option. If ACPI it enabled, you
must press and hold the power button to power down the system.

**Cache Control:** Select this choice to enable or disable the microprocessor cache. In addition, you can define the microprocessor cache type as write-back (WB) or write-through (WT). Selecting write-back mode will provide the maximum system performance.

You can also enable or disable video BIOS caching, and define buffers for video and option ROM caching.

**PCI Slot/Device Information:** Select this choice to view and identify system resources used by PCI devices. PCI devices automatically communicate with the server configuration information. This usually results in automatic configuration of a PCI device. If a conflict does occur, see “Resolving Configuration Conflicts” on page 36.

Use the Up Arrow (↑) or Down Arrow (↓) key to highlight the assignment that you want to change and press Enter. Use the Left Arrow (←) or Right Arrow (→) key to select from the list of available choices. An asterisk (*) indicates that more than one device shares a slot. After making changes, you can select:

- **Save Settings** to save the selected changes.
- **Restore Settings** to delete the changes and restore the previous settings.

**Note**

You can use the menu selections to save settings or restore settings for the PCI Slot/Device Information choice only. The Configuration/Setup Utility main menu selections save settings, restore settings, or load default settings for all other choices, but not the PCI Slot/Device Information choice.

The server uses a rotational interrupt technique to configure PCI devices. Because of this technique, you can install a variety of PCI devices that currently do not support sharing of PCI interrupts (IRQs). Multiple-function PCI devices use more than one interrupt.

**Memory Settings:** Select this choice to manually disable or enable a bank of memory.

If a memory error is detected during POST or memory configuration, the server can automatically disable the failing memory bank and continue operating with reduced memory capacity. If this occurs, you must manually enable the memory bank after the problem is corrected. Select **Memory Settings** from the Advanced Setup menu; then use the Up Arrow (↑) or Down Arrow (↓) key to highlight the bank that you want to enable. Use the Left Arrow (←) or Right Arrow (→) key to select **Enable**.
MPS Version Control: Select this choice to view and identify the multiprocessor specification (MPS) level. Some versions of the IBM OS/2 operating system use 1.1 as the MPS level. The default value is 1.4. Refer to the documentation that comes with the operating system for more information.

Error Logs: Select System Error Logs to choose to view either the POST error log or the system error log.

POST Error Log: Select POST Error Log to view the three most recent error codes and messages that the system generated during POST. You can clear the error log by selecting Clear error logs.

System Error Log: Select Error Log to view the system error log. The system error log contains all the system, error, and warning messages that the system has generated. You can use the up and down arrow keys to move between pages in the system error log.

Save Settings: After you make configuration changes, review them to be sure that they contain the correct information. If the information is correct, select Save Settings to save the selected changes.

Restore Settings: After you make configuration changes, review them to be sure that they contain the correct information. If the information is incorrect, or if you do not want to save these changes, select Restore Settings to delete the changes and restore the previous settings.

Load Default Settings: If you make configuration changes and then decide that you want to use default values instead, select Load Default Settings to cancel the changes and restore the factory settings.

Exit Setup: If you have made any changes, you will be asked if you want to save the changes or exit without saving the changes.
Configuring Options

Before installing a new device or program, read the documentation that comes with it. Reading the instructions helps you to determine the steps that are required for installation and configuration. The following list provides a preview of the actions that might be required to configure the server.

1. Run the Configuration/Setup Utility program and record the current configuration settings.
2. Set jumpers or switches on the server components.
   See “Changing Jumper Positions” on page 93 and “I/O Function Card Jumpers” on page 146.
3. Set jumpers or switches on the device.
   See the instructions that come with the adapter.
4. Install the adapter in the server.
   See “Working with Adapters” on page 173.
5. Install software programs.
   See the installation instructions that come with the software.
6. Resolve configuration conflicts.
   See “Resolving Configuration Conflicts” on page 36.
Resolving Configuration Conflicts

The resources used by the server consist of interrupt requests, direct memory access, I/O ports addresses, and memory. This information is useful when a resource configuration conflict occurs.

Conflicts in the configuration occur if:

- A device is installed that requires the same resource as another device. (For example, a conflict occurs when two adapters try to write to the same address space.)
- A device resource is changed (for example, changing jumper settings).
- A device function is changed (for example, assigning COM1 to two serial ports).
- A software program is installed that requires the same resource as a hardware device.

The steps required to resolve a configuration error are determined by the number and variety of hardware devices and software programs that you install. If a hardware configuration error is detected, a configuration error message appears after the server completes POST and before the operating system is loaded. You can bypass the error by pressing Esc while the error message is displayed.

The Configuration/Setup Utility program configures the system hardware and PCI IRQs. The program does not consider the requirements of the operating system or the application programs. See “Resolving Software Configuration Conflicts” on page 37 for additional information.

Resolving Hardware Configuration Conflicts

Use the following information to help resolve hardware configuration conflicts:

1. Run the Configuration/Setup Utility program to view and change resources used by the system functions and the installed options. Record the current settings before making any changes. (See “The Configuration/Setup Utility Program” on page 25 for instructions.)
2. Determine which adapter or device is causing the conflict.
3. Change adapter jumpers or switches. Some devices use jumpers and switches to define the system resources that the devices need. If the settings are incorrect or set to use a resource that cannot be shared, a conflict occurs and the device will remain deactivated by the configuration program.
5. Remove the device or adapter. Some configurations are not supported. If you must remove an adapter, see “Working with Adapters” on page 173.

Resolving Software Configuration

Conflicts: The memory-address space and IRQs used by some hardware options might conflict with addresses defined for use through application programs or the expanded memory specification (EMS). (EMS is used only with DOS.)

If a conflict exists, one or more of the following conditions might exist:

- The system cannot load the operating system.
- The system does not work.
- An application program does not operate, or it returns an error.
- Screen messages indicate a conflict exists.

To resolve conflicts, you can change the software or hardware configuration.

Note

Start the Configuration/Setup Utility program to view the addresses used by the server functions. (See “The Configuration/Setup Utility Program” on page 25 for instructions.)

The best way to resolve memory-address conflicts is to change the addresses used by the application program or the device driver. You can use the Configuration/Setup Utility program to change addresses.

If a device driver is causing a memory-address conflict, refer to the operating-system documentation or the documentation that comes with the device drivers.
Using the SCSISelect Utility

Note
If the server has a RAID adapter installed, use the configuration method supplied with the RAID adapter to view or change SCSI settings for attached devices.

The server comes with a menu-driven configuration utility, called SCSISelect, that allows you to view and change SCSI settings.

You can use the SCSISelect Utility to:
- View and change the default SCSI IDs
- Verify and change configuration conflicts
- Perform a low-level format on a SCSI hard disk
- Verify disk media

Starting the SCSISelect Utility: You can access this program when you start the server. The SCSISelect prompt appears after the IBM logo appears. Press Ctrl+* immediately after the SCSISelect prompt appears:

<<< Press <CTRL><A> for SCSISelect Utility! >>>

Use the Up Arrow (↑) or Down Arrow (↓) key to move the highlight bar to the various menu choices. Press Esc to return to the previous menu. Also, you can press the F5 key to switch between color and monochrome modes (if the monitor permits). To change the settings of the displayed items, follow the directions on the screen. Then, press Enter.

SCSISelect Utility Choices: The following choices appear on the SCSISelect Utility menu:
- Configure/View Host Adapter Settings
- SCSI Disk Utilities

Configure/View Host Adapter Settings: To view or change the SCSI controller settings, select Configure/View Host Adapter Settings and follow the directions on the screen.

Note
On the SCSISelect Utility menu, the SCSI controller is referred to as the Host Adapter.

This menu has the following choices:
- Host Adapter SCSI ID
  The default SCSI ID of the SCSI controller is 7. Do not change this value.
- SCSI Parity Checking
  The default value is Enabled. Do not change this value.
- Host Adapter SCSI Termination
The default value is Automatic. Do not change this value.

- Boot Device Configuration
  Select this choice to configure startable device parameters. Before you can make updates, you must know the ID of the device whose parameters you want to configure.

- SCSI Device Configuration
  Select this choice to configure SCSI device parameters. Before you can make updates, you must know the ID of the device whose parameters you want to configure.

  **Note**

  When the Maximum Sync Transfer Rate is set to 40.0, this value represents the transfer rate for UltraSCSI devices. When the Maximum Sync Transfer Rate is set to 20.0, this value represents the transfer rate for Fast SCSI devices.

- Advanced Configuration Options
  Select this choice to view or change the settings for advanced configuration options. These options include enabling support for large hard disk drives and support for drives with UltraSCSI speed.

To reset the SCSI controller defaults, press F6; then, follow the directions on the screen.

**SCSI Disk Utilities:** To see the IDs that are assigned to each SCSI device or to format a SCSI device, select **SCSI Disk Utilities** from the SCISISelect Utility menu.

To use the utility, select a drive from the list. Read the screens carefully before making a selection.

  **Note**

  If the following screen appears, you might have pressed Ctrl+A before the selected drives were ready. Restart the server and watch the SCISISelect messages as each drive spins up. After the drive that you want to view or format spins up, press Ctrl+A.
Unexpected SCSI Command Failure

<table>
<thead>
<tr>

Press 'Esc' to continue.

Performing a Low-Level Disk Format: You can use the Format Disk feature of the SCSISelect Utility to perform a low-level format on a hard disk drive.

Depending on the hard disk drive capacity, the low-level format program could take up to two hours.

When To Use the Low-Level Format Program:

- When you are installing software that requires a low-level format
- When you get recurring messages from the diagnostic tests directing you to run the Low-Level Format program on the hard disk drive
- As a last resort before replacing a failing hard disk drive

Note

For information about backing up all of the files, see the operating-system documentation.
Starting the Low-Level Format Program

| Attention |
The low-level format program erases all data and programs.

| Note |
If the server has a RAID adapter installed, refer to the RAID adapter documentation for instructions for performing a low-level format on a hard disk drive attached to the PCI RAID adapter.

1. If the hard disk is working, make a backup copy of all the files and programs on the hard disk drive.
2. Select Format Disk; then, follow the instructions on the screen.

| Note |
Hard disks normally contain more tracks than their stated capacity (to allow for defective tracks). A message appears on the screen if the defect limit is reached. If this happens, replace the drive.

3. To install an operating system after the hard disk drive is formatted, follow the instructions in the “Software and Netfinity Manager Reference” section of this Server Library.

Verify Disk Media: The verify disk media utility scans the drive for defective sectors. All recoverable information found on defective sectors is remapped to alternate sectors. This utility also indicates if the drive is defective. Use this utility if you suspect bad sectors on a disk drive.
What the IBM Netfinity 7000 M10 Offers

The unique design of the server takes advantage of advancements in symmetric multiprocessing (SMP), data storage, and memory management. The server combines:

- **Impressive performance using an innovative approach to SMP**
  
  The server supports up to four Intel Pentium II Xeon microprocessors. You can install multiple microprocessors in the server to enhance performance and provide SMP capability.

  The server is shipped with a Netfinity Advanced Remote Management Controller. With this adapter, in conjunction with the Netfinity Manager Advanced System Management service capabilities of Netfinity Manager, you can locally and remotely configure and monitor many features of the server. You can configure system-management events (such as POST, loader, and operating system timeouts or critical temperature, voltage, and tamper alerts). If any of these events occur, the Netfinity Advanced Remote Management Controller can forward an alert to another resource:
  - Another Netfinity Manager or other service-processor interface, through an Ethernet network or serial connection
  - A standard numeric pager
  - An alphanumeric pager

  You can dialout and directly access and control a remote Netfinity Advanced Remote Management Controller.

  In addition, you can remotely monitor, record, and replay all textual data generated during power-on self-test (POST) on a remote server with a Netfinity Advanced Remote Management Controller. While monitoring a remote system during POST, you can enter keyboard commands that will be relayed to the remote system.

  **Note**

  The Advanced Remote Management Controller is sometimes referred to as the *system management adapter*.

- **Large data-storage and hot-swap capabilities**

  All models of the server support up to four hot-swap hard disk drives. This *hot-swap* feature enables you to remove and replace hard disk drives without turning off the server.

- **Hot-plug PCI adapter capabilities**

  The server has twelve *hot-plug* slots for PCI adapters. With operating system support, you can replace failing hot-plug PCI adapters without turning off the server.
server. In addition, you can add PCI adapters in these slots without turning off the server, if this hot-add feature is supported by the operating system and the PCI adapter.

- **Redundant cooling and power capabilities**
  The redundant cooling and hot-swap capabilities of the fans in the server provide for continued operation if one of the fans fail. You can also replace a failing fan without turning off the server.

  **Note**
  Replace a fan that has failed as soon as convenient to maintain the redundant cooling capability of the server.

You can install an additional power supply to provide redundant power for the server, or if you have an optional redundant power supply installed, replace a failing power supply without turning off the server.

- **Large system memory**
  The memory bus in the server supports up to 8 GB of system memory. The memory controller provides error correcting code (ECC) support for up to 32 industry-standard, 3.3 V, 168-pin, single bank, 8-byte, dual in-line memory modules.

- **IBM ServerGuide CDs**
  The ServerGuide CDs included with IBM Netfinity servers provide programs to help you set up the server and install the network operating system (NOS). The ServerGuide program detects the hardware options installed, and provides the correct configuration program and device drivers. In addition, the ServerGuide CDs include a variety of application programs such as IBM Update Connector to help keep the server BIOS and microcode updated, and IBM Netfinity Manager for systems management.

  For more information about the ServerGuide CDs, see the “Software and Netfinity Manager Reference” section of this Server Library.

The server is designed to be cost-effective, powerful, and flexible. It uses peripheral component interconnect (PCI) bus architectures to provide compatibility with a wide range of existing hardware devices and software applications.

As always, the IBM server meets stringent worldwide certifications for power, electromagnetic compatibility (EMC), and safety. Refer to the “Help and Legal Information” section of this Server Library for additional information.
Advanced System Management

The Advanced System Management service, installed when you install Netfinity Manager, provides the most extensive functionality available with your Netfinity Advanced System Management PCI Adapter. Netfinity Manager is included with this server. If you do not install Netfinity Manager, many advanced Netfinity Advanced System Management PCI Adapter features will not be available to you. For information on how to install Netfinity Manager, see “Software and Netfinity Manager Reference” section of this Server Library.

The following information is for the Advanced System Management

- “Required Device Drivers” on page 45.
- “Device-Driver Installation Instructions” on page 45.
- “Starting Advanced System Management” on page 47.
- “Using a Serial Connection to Manage Remote Advanced System Management Controllers or Adapters” on page 48.
- “Configuration Information” on page 49.
- “Configuration Settings” on page 50.
- “Modem Settings” on page 54.
- “Automatic Dialout Settings” on page 60.
- “Event Log” on page 64.
- “Operational Parameters” on page 65.
- “System Power Control” on page 66.
- “Remote POST Console” on page 67.
- “Updating System Management Subsystem Microcode” on page 68.
- “Accessing the Advanced System Management Adapter II without Netfinity Manager” on page 69.
- “Establishing a Direct Connection to the Netfinity Advanced System Management PCI Adapter” on page 70.
- “Netfinity Advanced System Management PCI Adapter Menus” on page 73.
- “System Power Menu Selections” on page 74.
Required Device Drivers: The following device drivers are required:

- For OS/2 operating system
  IBMSPO.DLL and IBMSPO.SYS
- For Microsoft Windows NT operating system
  IBMSPW.DLL and IBMSPW.SYS
- For Novell NetWare operating system
  IBMSPN.NLM

Notes

1. If you plan to install Netfinity Manager, you must install the required device drivers before you install Netfinity Manager.

Device-Driver Installation Instructions: The device drivers necessary for the Netfinity Advanced System Management PCI Adapter to function properly can be installed in one of two ways:

- Use the CoPilot ApplicationGuide CD to install the device drivers.
  To install the device drivers with the CoPilot ApplicationGuide CD follow the instructions provided in the “Installing Application Programs” section of the “Software and Netfinity Manager Reference” section of this Server Library.

- Use the CoPilot ApplicationGuide CD and Diskette Factory to create the diskettes you will need to install the device drivers.
  You will need to create one of the following diskettes:
    - IBM Netfinity 7000-M10 Device Drivers for Advanced System Management, version 1.00
    - Advanced System Management Device Driver Diskette
  Follow the Diskette Factory instructions provided on the ApplicationGuide CoPilot CD to create the diskettes.

If you choose to use the ApplicationGuide CoPilot CD to install the device drivers you will not need to perform any additional steps to finish installing your device drivers.

If you choose to use Diskette Factory to create diskettes and manually install the device drivers, use the following instructions to complete the device driver installation.

1. Insert the diskette labelled IBM Netfinity 7000-M10 Device Drivers for Advanced System Management, version 1.00 or Advanced System Management Device Driver Diskette into the primary diskette drive.
For additional information, review the README file on the diskette.

2. At a command prompt, type the following command and then press Enter:
   - For OS/2 operating system
     `a:\os2\setup`
   - For Microsoft Windows NT operating system
     `a:\nt\setup`
   - For Novell NetWare operating system
     `load a:\netware\setup`

3. You will receive a prompt indicating the location (path and directory) where the device drivers (files) will be placed, and asking you if you want the files to be placed there.
   - If you want the files to be placed in the indicated directory, press Enter.
   - If you want the files to be placed in a different directory, specify the desired directory name; then, press Enter. Be sure to use a valid directory name, and include the complete path.

4. The required device drivers (files) for your operating system will be copied onto the hard disk, in the directory that you selected in step 3.
   - For OS/2 operating system
     The system will also update the CONFIG.SYS file.
   - For Microsoft Windows NT operating system
     The system goes into the registry, and all device drivers are loaded automatically. The device drivers will run immediately.
   - For Novell NetWare operating system
     The system will also update the AUTOEXEC.NCF file.

5. Remove the diskette from the diskette drive.

6. If you have the Microsoft Windows NT operating system, go to step 8.

7. If you have the OS/2 operating system or the Novell NetWare operating system:
   a. Perform the shutdown procedure that your operating system uses. Refer to your operating-system documentation for instructions.
   b. Press Ctrl-Alt-Del to restart your server. The device drivers are loaded automatically during server startup.

8. You have completed the device-driver installation procedure.
Notes

1. To obtain the current device-driver-diskette image for your operating system, go to http://www.pc.ibm.com on the World Wide Web and download the image to your server.
2. If you want to use IBM Update Connector to update your device drivers automatically, follow the instructions in your IBM ServerGuide package.

Starting Advanced System Management:
To start the Advanced System Management service, double-click on the Advanced System Management icon in the Netfinity Service Manager window. Then double-click on any of the selections available in the Advanced System Management window to access the function or configuration information that you need.

- Select **Configuration Information** to view detailed information about the system management subsystem, including random-access memory (RAM) microcode, read-only memory (ROM) microcode, and device-driver information. For more information on Configuration Information, see “Configuration Information” on page 49.
- Select **Configuration Settings** to configure many features of the system management subsystem. These features include system identification data, dial-in security settings, the time and date reported by the system management subsystem clock, timeout and delay values, and advanced modem settings. For more information on Configuration Settings, see “Configuration Settings” on page 50.
- Select **Automatic Dialout Settings** to configure the system management subsystems automatic dialout functions. For more information on Automatic Dialout Settings, see “Automatic Dialout Settings” on page 60.
- Select **Event Log** to view the contents of the system management subsystem Event Log. Information about all remote access attempts and dialout events that have occurred is recorded in the system management subsystem Event Log. For more information on the Event Log, see “Event Log” on page 64.
- Select **Operational Parameters** to view the current values or status of many system components monitored by the system management subsystem. For more information on Operational Parameters, see “Operational Parameters” on page 65.
- Select **System Power Control** to instruct the system management subsystem to power off the system, restart the system, or power on the system. For more
Select Remote POST Console to use the system management subsystem to remotely monitor, record, and replay all textual output generated during POST on a remote system that has a supported system management subsystem. For more information on using Remote POST, see “Remote POST Console” on page 67.

To update the microcode on your system management subsystem, from the Options pulldown menu, select Update Microcode... and then select System Management Subsystem. For more information on updating microcode, see “Updating System Management Subsystem Microcode” on page 68.

Using a Serial Connection to Manage Remote Advanced System Management Controllers or Adapters: If you want to use your system’s modem to dial out and access the system management subsystem on a remote system, use Serial Connection Control to establish a connection with the remote system and then start the Advanced System Management service. You can also use Serial Connection Control to establish a null modem connection to another system. For more information on Serial Connection Control, see the Netfinity Manager User’s Guide.
Notes

1. Be sure to check the **System Management Processor** check box in the Netfinity Serial Connection Control window when you create the Serial Connection Control entry. If this check box is not checked, the connection with the remote system management subsystem will fail. A null modem connection does not require that this box be checked.

2. When using Serial Connection Control to configure a Dialout Entry for use by the Advanced System Management service, be sure to enter the Login ID and Password for access to the remote system's system management subsystem, not the User ID and Password for access to Netfinity services on the remote system.

3. When creating a Serial Connection Control entry to establish a null modem connection to a remote system's Advanced System Management Adapter or controller, make sure that the **Port Baud Rate** value (configured using the Serial Connection Control service) is set to match the **Baud Rate** value (configured using the Advanced System Management service) of the target system. If the **Port Baud Rate** and the **Baud Rate** values do not match, the connection will fail.

**Configuration Information:** The Configuration Information window (shown in Figure 1) contains detailed information about the system management subsystem, including RAM microcode, ROM microcode, and device-driver information.

![Configuration Information](image)

_Figure 1. The Configuration Information window_
**Configuration Settings:** Use the selections available in the Configuration Settings window (see Figure 2 on page 50) to configure many features of the system management subsystem. These features include system identification data, dial-in security settings, the time and date reported by the system management subsystem clock, timeout and delay values, and advanced modem settings.

This window contains:
- System Identification group
- Dial-in settings group
- System Management Subsystem Clock group
- POST timeout, Loader timeout, O/S timeout, and Power off delay fields

This window also includes the Modem button. Select **Modem** to open the Modem Settings window (see “Modem Settings” on page 54).

**The System Identification Group:** The System Identification group contains two fields to help you identify the system that contains the system management subsystem.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Can be used to provide a name for the system, the name of the system's user, or the name of a contact.</td>
</tr>
<tr>
<td>Number</td>
<td>Can be used to identify the system with a specific serial or identification number, to record the phone number used to dial into the system, or to provide the phone number of a contact.</td>
</tr>
</tbody>
</table>

---

**Figure 2. The Configuration Settings window**

To change the information provided by these fields:

1. In the **Name** or **Number** field, type the system information you want to record.
2. Select **Apply** to save this information.
The Dial-In Settings Group: Use the selections available in the Dial-In Settings group to enable or disable dial-in support, and to enable users to dial in and access the system management subsystem. The Dial-In Settings group contains the following items.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User profile to configure</td>
<td>Use the spin buttons to select the user profile that you want to configure. This service supports up to twelve separate profiles on IBM Netfinity 7000 systems.</td>
</tr>
<tr>
<td>Login ID</td>
<td>Type in this field the login ID that will be used by the remote user. Up to 12 Login IDs can be configured. (This field is case sensitive.)</td>
</tr>
<tr>
<td>Note</td>
<td>A Login ID must be specified to remotely access the system management subsystem.</td>
</tr>
<tr>
<td>Set Password</td>
<td>A password must be provided along with the Login ID to allow a remote user to access the system management subsystem. After providing a Login ID, click on Set Password to open the Set Password window. (The fields in the Set Password window are case sensitive.)</td>
</tr>
<tr>
<td>Last login</td>
<td>Shows the date and time of the last successful login by a remote user.</td>
</tr>
<tr>
<td>Read only access</td>
<td>If the Read only access check box is checked, the users whose profile is selected will not be able to alter any of the system management subsystem settings when access is granted. The user will, however, be able to see all currently configured settings and values except passwords.</td>
</tr>
<tr>
<td>Dial back enabled</td>
<td>If the Dial back enabled check box is checked, the system management subsystem will automatically terminate the connection as soon as the user whose profile is selected logs in, and will then use the telephone number that is entered in the Number field to dial out and attempt to connect with a remote system.</td>
</tr>
</tbody>
</table>

If necessary, select Modem to access the Modem Settings window (see “Modem Settings” on page 54). From the Modem Settings window, you can specify modem settings and dialing settings.

To create a new login ID for a remote user:

1. In the Login ID field, type the ID that will be used by the remote user. This ID can be up to 8 characters.
2. Remote users must provide a password along with a login ID in order to access the system management subsystem. Select Set Password to open the Set Password window.

From the Set Password window:

a. In the Enter Password field, type a password.

Note

This password must be 5–8 characters in length and must contain at least one nonalphanumeric character.
b. In the **Re-enter Password** field, type the same password that you typed in the **Enter Password** field.

c. Click on **OK** to save this password and close the Set Password window.

3. Click on **Apply** to save the new user ID.

To delete the currently selected login ID:

1. Use the spin buttons beside the **User ID to configure** field to select a previously configured User profile.
2. Click on the **Login ID** field.
3. Using the Backspace or Delete key, delete the currently displayed login ID.
4. Click on **Apply** to remove the user ID.

**The System Management Subsystem Clock Group:** Use the selections available in the System Management Subsystem Clock group to set the time and date that is reported by the system management subsystem.

To change the currently set time or date:

1. Verify that there is a check in the **Set System Management Subsystem Clock** check box. This check box *must* be checked to enable the Advanced System Management to change the currently stored time and date values.
2. Use the spin buttons beside each field to set the time or date.
   - The **Time** fields represent, when viewed from left to right, hours, minutes, and seconds.
   - The **Date** fields represent, when viewed from left to right, month, date, and year.
3. Click on **Apply** to save the new time and date.

**POST Timeout:** The **POST timeout** field shows the number of seconds that the system management subsystem will wait for the system's power-on self-test (POST) to complete before generating a POST Timeout event. If POST takes longer than the configured amount of time to complete and the **POST timeout** check box (found in the **Enabled Alerts Dialout** group on the Automatic Dialout Settings window) is checked, the system management subsystem will automatically restart the system one time and will attempt to forward an alert to all enabled Dialout Entries. Once the system is restarted, **POST timeout** is automatically disabled.

To set the **POST timeout** value, use the spin buttons beside the **POST timeout** field to set the number of seconds that the system management subsystem will wait for POST to complete. Then, click on **Apply** to save this value.
For more information on the Automatic Dialout Settings window, see “Automatic Dialout Settings” on page 60.

**Loader Timeout:** The **Loader timeout** field shows the number of seconds that the system management subsystem will wait for the system’s loading process to complete before generating a Loader Timeout event. The Loader Timeout measures the amount of time that passes between the completion of POST and the end of operating system (O/S) startup. If this takes longer than the configured amount of time to complete and the **Loader timeout** check box (found in the **Enabled Alerts Dialout** group of the Automatic Dialout Settings window) is checked, the system management subsystem will automatically restart the system one time and will attempt to forward an alert to all enabled Dialout Entries. Once the system is restarted, **Loader timeout** is automatically disabled.

To set the Loader timeout value, use the spin buttons beside the **Loader timeout** field to set the number of seconds that the system management subsystem will wait between POST completion and O/S startup before generating a timeout event. Then, click on **Apply** to save this value.

For more information on the Automatic Dialout Settings window, see “Automatic Dialout Settings” on page 60.

**O/S Timeout:** A periodic signal is sent from the Netfinity Advanced System Management PCI Adapter to the O/S to confirm that the O/S is running properly. The O/S Timeout event occurs when the O/S the Netfinity Advanced System Management PCI Adapter performs its automatic dialout functions if there is no response to the signal; that is, if the O/S Timeout pulse is not detected.

The **O/S timeout** field shows the number of seconds that the system management subsystem will wait for the system’s operating system to respond before generating an O/S Timeout event. If the O/S takes longer than the configured amount of time to respond and the device driver is installed and running correctly, the system management subsystem will attempt to restart the system, and if the **O/S timeout** check box (found in the **Enabled Alerts Dialout** group of the Automatic Dialout Settings window) is checked, the system management subsystem will automatically restart the system one time and will attempt to forward an alert to all enabled Dialout Entries.

To set the O/S timeout value, use the spin buttons beside the **O/S timeout** field to set the number of seconds that the system management subsystem will wait for the system’s operating system to respond before generating an O/S Timeout event. Then, click on **Apply** to save this value.
For more information on the Automatic Dialout Settings window, see “Automatic Dialout Settings” on page 60.

**Power Off Delay:** The *Power off delay* field shows the number of seconds that the system management subsystem will wait for the system's operating system shutdown process to complete before powering off the system.

When the system management subsystem initiates a power down procedure and the *Power off* check box (found in the *Enabled Alerts Dialout* group of the Automatic Dialout Settings window) is checked, the system management subsystem will automatically attempt to forward an alert to all enabled Dialout Entries. This alert is forwarded after the system is powered off and the *Power off delay* time has passed.

To set the power off delay value, use the spin buttons beside the *Power off delay* field to set the number of seconds that the system management subsystem will wait for the system’s operating system shutdown to complete before powering off the system. Then, click on *Apply* to save this value.

For more information on the Automatic Dialout Settings window, see “Automatic Dialout Settings” on page 60.

**Other Configuration Settings Functions:** The Configurations Settings window also includes three additional buttons:

<table>
<thead>
<tr>
<th>Button</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refresh</td>
<td>Select <em>Refresh</em> to update all data that is shown on the System Management Subsystem Configuration Settings window, including date, time, and last login.</td>
</tr>
<tr>
<td>Reset</td>
<td>Select <em>Reset</em> to set all Advanced System Management settings back to their default values, including configuration settings, dialout settings, and advanced dialout settings.</td>
</tr>
<tr>
<td></td>
<td><strong>Important</strong> All previously configured system management subsystem settings will be permanently lost.</td>
</tr>
<tr>
<td>Cancel</td>
<td>Select <em>Cancel</em> to close this window without saving any changes.</td>
</tr>
</tbody>
</table>

**Modem Settings:** Use the Modem Settings window to specify advanced modem and dialing settings. To open this window, click on *Modem* from the Configuration Settings window (see “Configuration Settings” on page 50).
The Port Configuration Group: Use the Modem Settings group to specify and configure the modem that will be used to forward the alert when a System Management Subsystem Dialout Event occurs. The Port Configuration group contains the following items.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port to configure</td>
<td>Use the spin buttons to select the port that your modem is configured to use. This spin button will show only values that are available for use by your system management subsystem. The port that you select to use affects the availability of the modem for use by either the system management subsystem or the operating system. You can select Port A, Port B, or Port C.</td>
</tr>
<tr>
<td>Baud rate</td>
<td>Use the spin buttons to specify the baud rate of the modem.</td>
</tr>
<tr>
<td>Dialin enabled</td>
<td>If you select Port A on a Netfinity 7000 server, the modem will be available for use by the operating system until the system management subsystem uses the modem for the first time. After the system management subsystem takes control of the modem, the operating system will not be able to access or use the modem until the operating system is restarted.</td>
</tr>
<tr>
<td>Callen ID string</td>
<td>If you select Port B on a Netfinity 7000 server, the modem will be dedicated for use by the operating system only. The system management subsystem will not be able to access a modem that is configured to use Port B.</td>
</tr>
<tr>
<td>Dialin delay (minutes)</td>
<td>If you select Port C on a Netfinity 7000 server, the modem will be dedicated for use by the system management subsystem only. The operating system will not be able to access a modem that is configured to use Port C.</td>
</tr>
</tbody>
</table>

Figure 3. The Modem Settings window
**The Dialing Settings Group:** Use the Dialing Settings group to specify settings related to the modem, and to configure the modem that is used to forward an alert when a System Management Subsystem Dialout Event occurs. The Dialing Settings group contains the following items.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initialization string</td>
<td>Type the initialization string that will be used for the specified modem. A default string is provided (ATE0). Do not change this string unless your dialout functions are not working properly. If you need to change the initialization string, see &quot;Initialization String Guidelines&quot; on page 59.</td>
</tr>
<tr>
<td>Caller ID string</td>
<td>Type the initialization string that will be used to get Caller ID information from the modem.</td>
</tr>
<tr>
<td>Port selected</td>
<td>This check box indicates whether the port number currently displayed in the Port to configure field is the port that is currently designated for use by the system management subsystem. Check this check box if you want to configure the System Management Subsystem to use the currently displayed port number.</td>
</tr>
<tr>
<td>Null modem</td>
<td>Check this check box to use a null modem connection to allow access from a remote Netfinity system.</td>
</tr>
<tr>
<td>Return to factory settings string</td>
<td>Type the initialization string that returns the modem to its factory settings when the modem is initialized. The default is AT&amp;F0.</td>
</tr>
<tr>
<td>Query string</td>
<td>Type the initialization string that is used to find out if the modem is attached. The default is AT.</td>
</tr>
<tr>
<td>Escape string</td>
<td>Type the initialization string that returns the modem to command mode when it is currently talking to another modem (connected). The default is <strong>++.</strong></td>
</tr>
<tr>
<td>Escape guard time</td>
<td>Type in this field the length of time before and after the escape string is issued to the modem. This value is measured in 10 millisecond intervals. The default value is 1 second.</td>
</tr>
<tr>
<td>Dial prefix string</td>
<td>Type the initialization string that is used before the number to be dialed. The default is ATDT.</td>
</tr>
<tr>
<td>Dial postfix string</td>
<td>Type the initialization string that is used after the number is dialed to tell the modem to stop dialing. The default is the Carriage Return character or [M. ]</td>
</tr>
<tr>
<td>Auto-answer string</td>
<td>Type the initialization string that is used to tell modem to answer the phone when it rings. The default is to answer after two rings or ATS0=2.</td>
</tr>
<tr>
<td>Auto-answer stop</td>
<td>Type the initialization string that is used to tell the modem to stop answering the phone automatically when it rings. The default is ATS0=0.</td>
</tr>
</tbody>
</table>

Note:
If the Null modem check box is checked, you cannot send dialout alerts to other systems using a modem or receive dialout alerts from other systems.
<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dial-in enabled</td>
<td>Check this check box to enable remote users to dial into and access the system management subsystem. If this box is unchecked, remote users will be unable to remotely access the system management subsystem. Click on Apply after checking or unchecking this check box to save the new setting.</td>
</tr>
<tr>
<td>Dialout retry limit</td>
<td>Use the spin buttons to select the number of additional times that the Advanced System Management will attempt to forward an alert. The Dialout Retry Limit applies only to attempts to forward the alert information to an alphanumeric pager. If you are forwarding the alert information to either a Netfinity system or a numeric pager, only one attempt will be made to forward this information.</td>
</tr>
<tr>
<td>Dialout retry delay</td>
<td>Use the spin buttons to specify the number of seconds that the Advanced System Management will wait before retrying a dialout attempt.</td>
</tr>
<tr>
<td>Item</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Own port on startup</td>
<td>Check this check box to reserve a serial port for exclusive use by the system management subsystem. If the system management subsystem is built into your system, checking this box will reserve one of your system's serial ports. If the system management subsystem is an adapter, checking this box will reserve one of the adapter's integrated communications ports. Click on Apply after checking or unchecking this check box to save the new setting.</td>
</tr>
</tbody>
</table>

**Notes**

1. Check this box if you are configuring your system for dial-in access. If this check box is not checked, you will be unable to dial into this system unless the system management subsystem has reclaimed the port for a dialout. If you want to configure the system management subsystem to always be dial-in enabled, regardless of whether the system is currently powered up, you must check this check box. When this check box is checked, you cannot configure the specified port for use by your system.
2. Only the dedicated management port (C) and the shared serial port (A) are available for use by the Netfinity Advanced System Management PCI Adapter. The other serial port (B) is only available for use by the operating system.
3. Port C is dedicated for use by the Netfinity Advanced System Management PCI Adapter only. Port A is used by the operating system, and is available to the Netfinity Advanced System Management PCI Adapter only when one of the following conditions exists:
   - The server is powered off
   - The Netfinity Advanced System Management PCI Adapter needs a port to perform a Critical Dialout Event (in this case, the Netfinity Advanced System Management PCI Adapter seizing control of the port from the operating system, dials out, and then powers off the server to avoid damage to your hardware).
Initialization String Guidelines:

If you need to provide a new initialization string, refer to the user’s guide that came with your modem. Your initialization string must contain commands that configure your modem as follows:

- Command echoing OFF
- Online character echoing OFF
- Result codes ENABLED
- Verbal result codes ENABLED
- All codes and Connect messages with BUSY and DT detection
- Protocol identifiers added – LAPM/MNP/NONE V42bis/MNP5
- Normal CD operations
- DTR ON-OFF hang-up, disable AA and return to command mode
- CTS hardware flow control
- RTS control of receive data to computer
- Queued and nondestructive break, no escape state

The acronyms in these commands have the following meanings:

<table>
<thead>
<tr>
<th>Acronym</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AA</td>
<td>Auto Answer</td>
</tr>
<tr>
<td>CD</td>
<td>Carrier Detect</td>
</tr>
<tr>
<td>CTS</td>
<td>Clear to Send</td>
</tr>
<tr>
<td>DT</td>
<td>Data Transfer</td>
</tr>
<tr>
<td>DTR</td>
<td>Data Terminal Ready</td>
</tr>
<tr>
<td>RTS</td>
<td>Ready to Send</td>
</tr>
</tbody>
</table>

Initialization String Guidelines: If you need to provide a new initialization string, refer to the user’s guide that came with your modem. Your initialization string must contain commands that configure your modem as follows:

1. Specify Modem Settings.
2. Specify Dialing Settings.
3. Click on Apply to save these settings and return to the Automatic Dialout Settings window.
Automatic Dialout Settings: Use the Automatic Dialout Settings window (shown in Figure 4 on page 60) to configure the system management subsystem's automatic dialout functions. If you configure a Dialout Entry, the system management subsystem will attempt to forward an alert to a remote Netfinity system, a numeric pager, or an alphanumeric pager when any of the events selected from the Enabled Alerts Dialout group occur. This alert will contain information about the nature of the event that occurred, the time and date at which the event occurred, and the name of the system that generated the alert.

You can configure the Netfinity Advanced System Management PCI Adapter to dial out to multiple pagers or Netfinity Manager systems in response to individual critical and non-critical dialout events. Therefore, the Dialout status text will read DIALOUT ON as soon as the first telephone number dialout begins, then change to DIALOUT OFF when the dialout is completed, then change to DIALOUT ON again when the second telephone number is dialed, then change to DIALOUT OFF when the dialout is completed, and so on. If you click on Stop Dialout, the Netfinity Advanced System Management PCI Adapter hangs up, abandons the currently active dialout function, and moves on to the next one.

Your system management subsystem can be configured with up to six separate Dialout Entries.

Figure 4. The Automatic Dialout Settings window
Dialout Entry Information Group: To edit or create a Dialout Entry:

1. In the Name field, type the name of the person or system to which the alert will be forwarded. The information in the Name field is strictly for your use in identifying the Dialout Entry. If you are editing a previously configured Dialout Entry, select the entry that you want to edit from the Name selection list.

2. In the Number field, type the telephone number that will be used by the system's modem to dial out to a digital pager service. After the modem connects to the pager service, it will send numeric data specific to the dialout event.

   **Note**
   Depending on your paging service, you might need to increase the amount of time that this alert action waits after dialing the telephone number before it transmits the numeric data. To increase the amount of time that will pass before the numeric data is transmitted, add one or more commas (,) to the end of the telephone number. Each comma will cause the modem to wait two seconds before transmitting the numeric data.

3. In the PIN field, type the personal identification number required by your alphanumeric pager provider. This field will be active only if you select Alpha-numeric in the Type field.

4. From the Type selection list, select the type of connection the system management subsystem will attempt to make in order to forward the event notification. You can select Numeric (for standard pagers), Alpha-numeric (for alphanumeric pagers), or Netfinity (for connecting to a remote Netfinity system).

5. Check the Entry enabled check box to activate this Dialout Entry. If the Entry enabled check box is not checked, no dialouts will be made to this entry.

6. Select dialout events from the Enabled Alerts Dialout group. If any of the checked events occur, the system management subsystem will dial out to the telephone number specified in the Number field and forward an alert describing the event using the method selected in the Type field. For more detailed information about dialout events, see “Enabled Alerts Dialout Group” on page 62.

7. Click on Apply/Add to save these settings.

To remove a previously configured Dialout Entry, select the name of the entry from the Name selection list and then select Delete.
Enabled Alerts Dialout Group: Use the selections available in the Enabled Alerts Dialout group to specify which system management subsystem events will result in all currently configured Dialout Entries being contacted by the system management subsystem. Any selected items will, if detected by the system management subsystem, result in an alert describing the event being forwarded, using the method selected in the Type field, to the recipient specified by the Dialout Entry.

If the alert is being forwarded to a pager, Advanced System Management will include information about the event that triggered the alert. If the alert is forwarded to a numeric (or standard), pager, the page will include a code number that corresponds to the triggering event. If the alert is forwarded to an alphanumeric pager, the page will include both a code number and a text string that describe the triggering event. For more information on the numeric codes and text strings that are transmitted to pagers, refer to the following tables.

The Enabled Alerts Dialout group is divided into the Critical, Non-critical, and System groups. The Critical Enabled Alerts Dialout group contains the following items.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description (if checked)</th>
<th>Numeric Code</th>
<th>Text String</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature</td>
<td>The system management subsystem will dial out and then automatically initiate a system shutdown if any monitored temperatures exceed their threshold values.</td>
<td>00</td>
<td>Temperature</td>
</tr>
<tr>
<td>Voltage</td>
<td>The system management subsystem will dial out if the voltages of any monitored power sources fall outside their specified operational ranges.</td>
<td>01</td>
<td>Voltage</td>
</tr>
<tr>
<td>Tamper</td>
<td>The system management subsystem will add an entry in the Event Log if six consecutive remote login attempts fail.</td>
<td>02</td>
<td>Tamper</td>
</tr>
<tr>
<td>Multiple fan failure</td>
<td>The system management subsystem will dial out if two (or more) of the system's cooling fans fail and will automatically initiate a system shutdown.</td>
<td>03</td>
<td>Multiple Fan Failure</td>
</tr>
<tr>
<td>Power failure</td>
<td>The system management subsystem will dial out if the system's power supply fails.</td>
<td>04</td>
<td>Power Failure</td>
</tr>
<tr>
<td>Hard disk drive</td>
<td>The system management subsystem will dial out if one or more of the hard disk drives in the system fail.</td>
<td>05</td>
<td>Hard Drive</td>
</tr>
</tbody>
</table>
The **Non-critical** Enabled Alerts Dialout group contains the following items.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description (if checked)</th>
<th>Numeric Code</th>
<th>Text String</th>
</tr>
</thead>
<tbody>
<tr>
<td>Voltage regulator module failure</td>
<td>The system management subsystem will dial out and then automatically initiate a system shutdown if the voltage regulator module (VRM) fails.</td>
<td>06</td>
<td>VRM Failure</td>
</tr>
<tr>
<td>Temperature</td>
<td>The system management subsystem will dial out if any monitored temperatures exceed their threshold values. However, unlike the Critical Temperature event, this Alerts Dialout will not initiate a system shutdown automatically.</td>
<td>12</td>
<td>Non-critical Temperature</td>
</tr>
<tr>
<td>Single fan failure</td>
<td>The system management subsystem will dial out if one of the system's cooling fans fail.</td>
<td>11</td>
<td>Single Fan Failure</td>
</tr>
<tr>
<td>Voltage</td>
<td>The system management subsystem will dial out if any of the monitored voltages exceed their threshold values.</td>
<td>13</td>
<td>Voltage</td>
</tr>
</tbody>
</table>

The **System** Enabled Alerts Dialout group contains the following items.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description (if checked)</th>
<th>Numeric Code</th>
<th>Text String</th>
</tr>
</thead>
<tbody>
<tr>
<td>POST timeout</td>
<td>The system management subsystem will dial out if the POST timeout value (specified in the System Management Subsystem Configuration Settings window) is exceeded.</td>
<td>20</td>
<td>POST Hang</td>
</tr>
<tr>
<td>Loader timeout</td>
<td>The system management subsystem will dial out if the Loader timeout value (specified in the System Management Subsystem Configuration Settings window) is exceeded.</td>
<td>26</td>
<td>Loader Watchdog Failure</td>
</tr>
<tr>
<td>O/S timeout</td>
<td>The system management subsystem will dial out if the O/S timeout value (specified in the System Management Subsystem Configuration Settings window) is exceeded.</td>
<td>21</td>
<td>OS Hang</td>
</tr>
<tr>
<td>Power off</td>
<td>The system management subsystem will dial out if the system is powered off.</td>
<td>23</td>
<td>System Power Off</td>
</tr>
<tr>
<td>Power on</td>
<td>The system management subsystem will dial out if the system is powered on.</td>
<td>24</td>
<td>System Power On</td>
</tr>
</tbody>
</table>
Event Log: Use Event Log to open the System Management Subsystem Logs window (shown in Figure 5). This window contains all entries that are currently stored in the system management subsystem event log. Information about all remote access attempts and dialout events that have occurred is recorded in the system management subsystem event log.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description (if checked)</th>
<th>Numeric Code</th>
<th>Text String</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application</td>
<td>The system management subsystem will dial out if it receives a Netfinity alert (Netfinity can forward alerts directly to the system management subsystem using the Alert Manager Forward Alert to System Management Subsystem action).</td>
<td>22</td>
<td>Application Logged Event</td>
</tr>
<tr>
<td>PFA</td>
<td>The system management subsystem will dial out if it receives a Predictive Failure Analysis (PFA) alert from the system.</td>
<td>27</td>
<td>PFA</td>
</tr>
</tbody>
</table>

Event Log: Use Event Log to open the System Management Subsystem Logs window (shown in Figure 5). This window contains all entries that are currently stored in the system management subsystem event log. Information about all remote access attempts and dialout events that have occurred is recorded in the system management subsystem event log.
Notes

1. If you are using the Advanced System Management service with an Netfinity Advanced System Management PCI Adapter installed in a Netfinity 7000 server, the event log might contain entries that begin with the text “i2C Message.” These messages are normal and are intended for use by IBM servicers in the event of system problems.

2. If you are using the Advanced System Management service with a Netfinity 7000 server, the event log will also include any POST error messages.

The following functions are available from the Options pulldown menu in the System Management Subsystem Logs window:

- **Load**
  Refreshes the contents of the System Management Subsystem Logs window.

- **Print to File**
  Saves the contents of the System Management Subsystem Logs window to a text file.

- **Print to Printer**
  Sends the contents of the System Management Subsystem Logs window to a printer attached to your system.

- **Clear Log**
  Erases all entries that are currently stored in the system management subsystem Event Log (including any entries that are not currently visible in the System Management Subsystem Log window).

Note

Once you use Clear Log to erase the entries in the system management subsystem Event Log, they are permanently erased and cannot be retrieved.

Operational Parameters: The Operational Parameters window (see Figure 6 on page 66) shows the current values or status of many system components monitored by the system management subsystem. Available values include:

- Power supply voltages (including +5 V ac, +12 V ac, -3.3 V ac, -12 V ac; Netfinity 7000 servers feature additional -5 V ac and Voltage Regulation Module [VRM] monitors).

- Current temperatures and threshold levels for system components such as far-end adapter, center adapter, microprocessors, I/O board, and DASD backplane.
Note

Monitored system components vary by system management subsystem.

- System state (including O/S started, O/S running, POST started, POST stopped (error detected), and system powered off/state unknown).
- System power status (on or off).
- Power on hours; the total number of hours that the system has been powered on. (This is a cumulative count of all powered-on hours, not a count of hours since the last system restart).

Figure 6. The Operational Parameters window

System Power Control: Use the System Power Control window to instruct the system management subsystem to power off the system, restart the system, or power on the system. To initiate any of the power control options, you must first check the Enable power control options check box. If this check box is unchecked, the Power Control Options field will not be available.

Figure 7. The System Power Control window

The following System Power Control functions are available at all times.
If you are connected to the system management subsystem through a modem, the Power on now selection will also be available. This function powers up the system and allows the microprocessor to perform POST, loading, and O/S startup procedures.

To initiate a Power Control Option:

1. Check the Enable power control options check box.

**Note**

To initiate any of the power control options, you must first check the Enable power control options check box. If this check box is unchecked, the Power Control Options field will not be available.

2. From the Power Control Options field, select the Power Control Option you want to activate.

3. Click on Apply.

**Remote POST Console:** You can use the Advanced System Management Remote POST Console function to remotely monitor, record, and replay all textual output generated during POST. To monitor and record the POST data on a remote system:

1. Connect to the remote system's system management subsystem.
2. Open the Remote POST window.
3. Restart the remote system (using the Advanced System Management's System Power Control functions).

All POST data will be displayed in and recorded by the Remote POST Console as the remote system completes POST. While you are monitoring POST on a remote system, all local keystrokes are relayed automatically to the remote system, enabling you to interact with the POST process on the remote system.

To review data after POST completes, disconnect from the remote system and use the Replay functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power off with O/S shutdown</td>
<td>Performs an O/S shutdown before removing power from the system.</td>
</tr>
<tr>
<td>Power off now</td>
<td>Immediately removes power from the system.</td>

</table>

Netfinity 7000-M10 - Type 8680 67
To begin playing the recorded POST data, or to resume playing the recorded POST data after stopping playback, click on **Replay Last POST**.

To halt playback of the recorded POST data, click on **Stop**.

To resume viewing the recorded POST data from the beginning, click on **Restart**.

Select **Fast**, **Medium**, or **Slow** to specify the speed at which the recorded POST data is displayed in the Remote POST window.

**Note**
Remote POST data can be replayed only when you are not connected to a remote system's system management subsystem.

**Updating System Management Subsystem Microcode:** To update the system management subsystem microcode:

1. From the **Options** pulldown menu, select **Update Microcode...** and then select **System Management Subsystem**.

   A file selection window appears.

2. Use the file selection window to select the source disk drive (or diskette drive) and directory where the system management subsystem microcode update is located.

3. Select **OK** to continue.

4. Warning notices will appear, asking that you verify that you want to continue. Select **OK** to continue or **Cancel** to stop the microcode update process.
5. When you have verified that you want to proceed with updating the system management subsystem microcode, the Advanced System Management service will apply the microcode update to the system management subsystem. During this process, some of the monitoring functions of some system management subsystems (such as the environmental monitors available with the Netfinity 7000 Netfinity Advanced System Management PCI Adapter) will be disabled. Once the microcode update is complete, all system monitoring will resume.

Accessing the Advanced System Management Adapter II without Netfinity Manager: If you are unable to use Netfinity Manager to access and manage your Netfinity Advanced System Management PCI Adapter, you can use a terminal program and a modem to connect directly to the Netfinity Advanced System Management PCI Adapter. This modem should be connected to serial port A or management port C to use the remote functions. (Refer to your server User's Handbook for information on serial port A and management port C. For more information on configuring the Netfinity Advanced System Management PCI Adapter modem, see “Modem Settings” on page 54.)

Also, if the Netfinity Advanced System Management PCI Adapter is attached to and configured to use a TCP/IP network (using the Ethernet port), you can use a TELNET session or web browser to connect to the Netfinity Advanced System Management PCI Adapter.

When connected, you will be able to access a variety of monitor, configuration, and error log data. You can also:

- Power the remote system on or off
- Shut down and restart the server
- Initiate remote video mode on the system management subsystem

Remote video mode enables you to remotely monitor all textual output generated during POST. All POST data will be displayed in the terminal program window as the remote system completes POST. While you are monitoring POST on the remote system, all local keystrokes are relayed automatically to the remote system, enabling you to use POST utilities (such as system configuration, redundant array of independent disks [RAID] mini-configuration program, and diagnostic programs) that can be accessed during POST.
Establishing a Direct Connection to the Netfinity Advanced System Management PCI Adapter:

You can establish a direct connection to the Netfinity Advanced System Management PCI Adapter in one of three ways:

- Connect using a serial connection and a terminal program
- Connect using a TCPIP network connection and a TELNET session
- Connect using a TCPIP network connection and a web browser

Using a Terminal Program to Connect: To use a terminal program to establish a connection with the system management subsystem:

1. Use a terminal program to establish a connection with the system management subsystem modem.

   Use the following modem settings:
   - **Baud**: 57.6 k
   - **Data Bits**: 8
   - **Parity**: None
   - **Stop Bits**: 1
   - **Flow Control**: Hardware

2. Dial the Netfinity Advanced System Management PCI Adapter.

3. Log in to the system management subsystem.

   When you have established a connection with the system management subsystem, you will be prompted for a username and password. You must provide a username and password combination that has been previously configured for use with the system management subsystem.

   You can use one of two username and password combinations:
   - The default username (USERID) and password (PASSW0RD)

     **Note**

     The default username and password are case sensitive. You must use all caps, and the “0” in PASSW0RD is the numeral zero.

   - A username and password that you define using the Advanced System Management service and Netfinity Manager
Important

For security purposes, change the username and password using the Advanced System Management service. For more information, see “Configuration Settings” on page 50.

If you update the system management subsystem microcode, the default username (USERID) and password (PASSW0RD) are reset. If you had previously changed them, you will need to change them again.

When you have logged in, you will be presented with the Netfinity Advanced System Management PCI Adapter menu system. For more information, see “Netfinity Advanced System Management PCI Adapter Menus” on page 73.

Using a TELNET Session to Connect: To use a TELNET session to establish a connection with the system management subsystem:

1. TELNET to the TCPIP address that has been assigned to the Netfinity Advanced System Management PCI Adapter.
2. Log in to the system management subsystem.

When you have established a connection with the system management subsystem, you will be prompted for a username and password. You must provide a username and password combination that has been previously configured for use with the system management subsystem.

You can use one of two username and password combinations:

- The default username (USERID) and password (PASSW0RD)

  Note

  The default username and password are case sensitive. You must use all caps, and the “0” in PASSW0RD is the numeral zero.

- A username and password that you define using the Advanced System Management service and Netfinity Manager
**Important**

For security purposes, change the username and password using the Advanced System Management service. For more information, see “Configuration Settings” on page 50.

If you update the system management subsystem microcode, the default username (USERID) and password (PASSW0RD) are reset. If you had previously changed them, you will need to change them again.

When you have logged in, you will be presented with the Netfinity Advanced System Management PCI Adapter menu system. For more information, see “Netfinity Advanced System Management PCI Adapter Menus” on page 73

**Using a Web Browser to Connect:** To use a web browser to establish a connection with the system management subsystem:

1. Type in the location or URL address field of your web browser the TCPIP address that has been assigned to the Netfinity Advanced System Management PCI Adapter.
2. Log in to the system management subsystem.

When you have established a connection with the system management subsystem, you will be prompted for a username and password. You must provide a username and password combination that has been previously configured for use with the system management subsystem.

You can use one of two username and password combinations:

- The default username (USERID) and password (PASSW0RD)

**Note**

The default username and password are case sensitive. You must use all caps, and the “0” in PASSW0RD is the numeral zero.

- A username and password that you define using the Advanced System Management service and Netfinity Manager
Important

For security purposes, change the username and password using the Advanced System Management service. For more information, see “Configuration Settings” on page 50.

If you update the system management subsystem microcode, the default username (USERID) and password (PASSW0RD) are reset. If you had previously changed them, you will need to change them again.

When you have logged in, you will be presented with the Netfinity Advanced System Management PCI Adapter menu system. For more information, see “Netfinity Advanced System Management PCI Adapter Menus”

Netfinity Advanced System Management PCI Adapter Menus: When you have logged into the system management subsystem, the following main menu appears:

2 Monitors
3 Error Logs
4 System Management Adapter Configuration
5 System Services
6 System Power
7 Boot
8 Remote Terminal Status
Y Disconnect Current Logon
Z Start Remote Video

To access a menu item, press the number or letter that corresponds to the information that you want to access (or, if you are using a web browser to access the Netfinity Advanced System Management PCI Adapter, click on the menu selection that corresponds to the information that you want to access). After you select a menu item, subsequent menus will offer more specific information that pertains to the selection you made from the main menu. To return to the main menu, press the Esc key.

Note

- Selecting Y Disconnect Current Logon ends the current session and requires you to enter a new username and password before continuing.
- Selecting Read displays the last entry.
- Selecting Read Last steps backwards through the entries.
- Selecting Write executes the command.
When you are finished accessing the system management subsystem using a terminal program, select **Disconnect Current Logon** from the main menu and then use your terminal program to close the connection to the system management subsystem.

### System Power Menu Selections

You can use the selections available from the System Power menu to:

- View data regarding the current server power status
- View data regarding the server power configuration
- Power the server off
- Power the server on

To access these functions:

1. Use a terminal program, TELNET session, or web browser to establish a connection with the system management subsystem modem.
2. Log in to the system management subsystem.

When you have established a connection with the system management subsystem, you will be able to access the menu selections:

<table>
<thead>
<tr>
<th>Menu Selection</th>
<th>Data Available for Viewing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Monitors</td>
<td>I/O board temperature, CPU temperatures, voltage readings, voltage regulator module readings, fan status</td>
</tr>
<tr>
<td>Error Logs</td>
<td>Contents of system error log</td>
</tr>
<tr>
<td>System Management</td>
<td>System management subsystem modem configuration, dial-out entries, dial-out alerts, dial-in logins, system status, thresholds, system statistics, vital product data (VPD) information, and system state</td>
</tr>
<tr>
<td>Adapter Configuration</td>
<td></td>
</tr>
<tr>
<td>System Services</td>
<td>Status of system management subsystem watchdog timers and event alerts sent to the host system</td>
</tr>
<tr>
<td>System Power</td>
<td>Current system power status, power-off configuration, and power-off delay values.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> You can use selections available from the System Power menu to power the system on or off. For more information, see &quot;System Power Menu Selections&quot; on page 74.</td>
</tr>
<tr>
<td>Boot</td>
<td>You can use selections available from the Boot menu to shutdown and restart your system or to restart the system management subsystem. For more information, see &quot;Boot Menu Selections&quot; on page 76.</td>
</tr>
<tr>
<td>Remote Terminal Status</td>
<td>Current remote terminal status</td>
</tr>
<tr>
<td>Start Remote Video</td>
<td>Use Start Remote Video to enable your terminal program to remotely monitor and manage the server during POST. For more information, see &quot;Using Remote Video Mode to Monitor and Access POST&quot; on page 77.</td>
</tr>
</tbody>
</table>

When you have finished accessing the system management subsystem using a terminal program, select **Disconnect Current Logon** from the main menu and then use your terminal program to close the connection to the system management subsystem.
prompted for a username and password. You must provide a username and password combination that has been previously configured for use with the system management subsystem. You can use one of two username and password combinations:

- The default username (USERID) and password (PASSW0RD)

  **Note**

  The default username and password are case sensitive. You must use all caps, and the “0” in PASSW0RD, is the numeral zero.

- A username and password that you define using the Advanced System Management service and Netfinity Manager

  **Important**

  For security purposes, change the username and password using the Advanced System Management service. For more information see “Configuration Settings” on page 50.

  If you update the system management subsystem microcode, the default username (USERID) and password (PASSW0RD) are reset. If you had previously changed them, you will need to change them again.

When you have logged into the system management subsystem, the following main menu appears:

2 Monitors  
3 Error Logs  
4 System Management Adapter Configuration  
5 System Services  
6 System Power  
7 Boot  
8 Remote Terminal Status  
Y Disconnect Current Logon  
Z Start Remote Video

3. Select **6 System Power**.

   The following System Power menu appears:

   1 Current Power Status  
   2 Power Configuration  
   3 Power On  
   4 Power Off

4. Select a System Power menu item.

   - Select **1 Current power Status** for information about the current server power status.
   - Select **2 Power Configuration** for information about the server power configuration.
   - Select **3 Power On** to power the server on (if it is currently powered off).
   - Select **4 Power Off** to power the server off (if it is currently powered on).
Boot Menu Selections: You can use the selections available from the Boot menu to:

- Shut down the server operating system and then restart the server
- Restart the server immediately, without first performing an operating system shutdown
- Restart the system management subsystem

To access these functions:

1. Use a terminal program, TELNET session, or web browser to establish a connection with the system management subsystem modem.
2. Log in to the system management subsystem.

When you have established a connection with the system management subsystem, you will be prompted for a username and password. You must provide a username and password combination that has been previously configured for use with the system management subsystem. You can use one of two username and password combinations:

- The default username (USERID) and password (PASSW0RD)
  
  **note**
  
  The default username and password are case sensitive. You must use all caps, and the “0” in PASSW0RD, is the numeral zero.
  
- A username and password that you define using the Advanced System Management service and Netfinity Manager

**Important**

For security purposes, change the username and password using the Advanced System Management service. For more information see “Configuration Settings” on page 50.

If you update the system management subsystem microcode, the default username (USERID) and password (PASSW0RD) are reset. If you had previously changed them, you will need to change them again.

When you have logged into the system management subsystem, the following main menu appears:

2 Monitors
3 Error Logs
4 System Management Adapter Configuration
5 System Services
6 System Power
7 Boot
B Remote Terminal Status
Y Disconnect Current Logon
Z Start Remote Video
3. Select 7 Boot.

The following Boot menu appears:

1 Reboot w/OS Shutdown
2 Reboot immediately
3 Restart SP

4. Select a Boot menu item.

- Select 1 Reboot w/OS Shutdown to shutdown the server operating system and then restart the server.
- Select 2 Reboot immediately to restart the server immediately, without first shutting down the operating system.
- Select 3 Restart SP to restart the system management subsystem.

Using Remote Video Mode to Monitor and Access POST:

You can use a terminal program, TELNET session, or web browser to remotely monitor all textual output generated during POST. All POST data will be displayed in the terminal program window as the remote system completes POST. While you are monitoring POST on the remote system, all local keystrokes are relayed automatically to the remote system, enabling you to use POST utilities (such as system configuration, RAID mini-configuration program, or diagnostic programs) that can be accessed during POST.

To use Remote Video Mode to monitor and access POST on the server:

1. Use a terminal program, TELNET session, or web browser to establish a connection with the system management subsystem modem.
2. Log in to the system management subsystem.

When you have established a connection with the system management subsystem, you will be prompted for a username and password. You must provide a username and password combination that has been previously configured for use with the system management subsystem. You can use one of two username and password combinations:

- The default username (USERID) and password (PASSW0RD)

  Note
  The default username and password are case sensitive. You must use all caps, and the “0” in PASSW0RD, is the numeral zero.

- A username and password that you define using the Advanced System Management service and Netfinity Manager
Important

For security purposes, change the username and password using the Advanced System Management service. For more information, see “Configuration Settings” on page 50.

If you update the system management subsystem microcode, the default username (USERID) and password (PASSW0RD) are reset. If you had previously changed them, you will need to change them again.

When you have logged into the system management subsystem, the following main menu appears:

2 Monitors
3 Error Logs
4 System Management Adapter Configuration
5 System Services
6 System Power
7 Boot
B Remote Terminal Status
Y Disconnect Current Logon
Z Start Remote Video

3. Start (or restart) the server.
   • If the remote server is currently powered off:
     a. Select 6 System Power from the main menu.
     b. Select 4 Power On from the System Power menu.
   • If the server is currently powered on, you must restart the server. You can use selections from the System Power menu or the Boot menu to restart the server in several ways.

To restart the server using System Power menu selection:
   a. Select 6 System Power from the main menu.
   b. Select 3 Power Off from the System Power menu.
   c. Once the server has powered off, select 4 Power On to restore power to the server.

To restart the server using Boot menu selections:
   a. Select 7 Boot from the main menu.
   b. Select either 1 Reboot w/OS Shutdown or 2 Reboot Immediately to restart the server.

Note

For information on the System Power and Boot menus, see “System Power Menu Selections” on page 74 and “Boot Menu Selections” on page 76.
4. After you restart the server, return to the main menu and select Z Start Remote Video.

Once you have started Remote Video mode on the system management subsystem, all textual output generated during POST will be sent to your terminal window or TELNET session. Your terminal or TELNET session will also act as a fully-active remote session, enabling you to enter keyboard commands that will be sent to the remote server. In this way, you can enter key commands and key-combinations that access POST operations and utilities, such as system setup or the RAID mini-configuration program.

When you have finished using Remote Video mode, press Ctrl+R, then press Ctrl+E, and then press Ctrl+T. This will end Remote Video mode and return you to the main menu.
Netfinity Advanced System Management Token Ring Connection Option

The Netfinity Advanced System Management Token Ring Connection includes an IBM Turbo 16/4 Token Ring PC Card that you install in the PCMCIA slot on the Advanced System Management PCI Adapter. The option also includes a PC Card to 9-pin D-shell cable that you first connect to the PC card and then route through the rear chassis cut-out on the server. Finally, the option includes a complete copy of Netfinity Manager version 5.20.2. The licensed version of Netfinity Manager, shipped with the option replaces the licensed version of Netfinity Manager that comes with ServerGuide (included with the Netfinity server). The version of Netfinity Manager, shipped with the option, includes advanced features that enable you to configure and control the Advanced System Management PCI Adapter.

Attention

After you have installed the Netfinity Advanced System Management Token Ring Connection, you must not enable or use the Ethernet port that is included on the Advanced System Management PCI Adapter. Enabling the Ethernet port while the IBM Turbo 16/4 Token Ring PCMCIA card is installed on the adapter will cause the system to become unstable. To enable, configure, or use the Ethernet port, you must first remove the IBM Turbo 16/4 Token Ring PCMCIA card from the Advanced System Management PCI Adapter.

The option ships with the following components:
- IBM Turbo 16/4 Token Ring PC Card
- Token Ring Cable
- Safety Information Booklet
- Netfinity Manager CD-ROM

Installation Instructions

Attention

Before proceeding, read the safety information included with the option.

To install the Netfinity Advanced System Management Token Ring Connection, do the following:
1. Use the Netfinity Manager Advanced System Manager service to disable the Ethernet network interface (if it is enabled).
   This step is necessary only if you have used the Advanced System Management service previously to
2. Shut down and power off the server.
3. Disconnect the server power cord from the wall socket.
4. Remove the server cover.
5. Locate and remove the Advanced System Management PCI Adapter.
   To remove the Advanced System Management PCI Adapter from the server:
   a. Unplug all connections from the back of the adapter.
   b. Carefully move aside any cables (such as DASD cables or power cables) that block access to the Advanced System Management PCI Adapter.
   c. Disconnect the power cable from the top of the Advanced System Management PCI Adapter.
   d. Carefully remove the adapter from the server.
6. Install the PCMCIA card 2 into the PCMCIA slot on the adapter 1 as shown in the following figure.

7. Connect one end of the token ring cable 2 to the PCMCIA connector on the PCMCIA card 1 as shown in the following figure.
8. Lock the PCMCIA connector by pushing the slide 4 forward as shown.

9. Locate and remove the external connector knockout on the back panel of the server.

To remove the external connector knockout, use a flat blade screwdriver to carefully tap the bottom edge of the knockout panel. The knockout will bend toward the interior of the server. After the external connector knockout has bent in slightly, insert the tip of the screwdriver between the edge of the knockout and the back panel of the server and gently pry the knockout off.

Attention
Be careful not to bend the back panel of the server while removing the knockout.

10. Reinstall the Advanced System Management PCI Adapter. Be sure to reconnect any cables that you disconnected when removing the adapter from the server.

11. Insert the end of the token ring cable 3 into the external connector opening and secure it in place with the included screws.

12. Replace the server cover and reconnect the server to a power source.

System Reliability Considerations
To help ensure proper cooling and system reliability, make sure:
- Each of the drive bays has either a drive or a filler panel installed.
- Each of the power supply bays has either a power supply or a filler panel installed.
- The top cover is in place during normal operation.
- The front access cover is in place during normal operation.
- There is at least 305 mm (12 inches) of ventilation space at the front and rear of the server.
- The Power switch on the power supply is off before you remove a functional power supply.
- Cables for optional adapters are routed according to the instructions provided with the adapters.
- A fan that has failed is replaced as soon as convenient to help maintain the redundant cooling capability.
Specifications
The following table contains the specifications for the Netfinity 7000 M10.

Size
- Depth: 650 mm (25.6 in.)
- Height: 489 mm (19.25 in.) (11 U)
- Width: 440 mm (17.3 in.)

Weight
- Unpacked, minimum configuration: 39 kg (85 lb.)
- Unpacked, maximum configuration: 70.31 kg (155 lb.)

Electrical Input
- Sine-wave input (50± or 60± Hz) is required
- Input voltage
  - Low range
    - Minimum: 90 V ac
    - Maximum: 137 V ac
  - High range
    - Minimum: 180 V ac
    - Maximum: 265 V ac
- Input kilovolt-amperes (KVA) approximately
  - Minimum configuration as shipped: 0.2 KVA
  - Maximum configuration: 0.78 KVA

Environment
- Air temperature
  - System on: 10° to 35° C (50° to 95° F)
    Altitude: 0 to 914 m (3000 ft.)
  - System on: 10° to 32° C (50° to 89.6° F)
    Altitude: 914 m (3000 ft.) to 2133 m (7000 ft.)
  - System off: 10° to 43° C (50° to 110° F)
    Maximum altitude: 2133 m (7000 ft.)
- Humidity
  - System on:
    8% to 80%; maximum wetbulb 23° C (73.4° F)
  - System off:
    8% to 80%; maximum wetbulb 27° C (80.6° F)
- Altitude: 0 to 2133 m (0 to 7000 ft.)

Electrostatic Discharge
- Tested to 20 KV
Immunity

- Verified to comply with
  EN 50082-2

Acoustical Noise Emissions Values

- Declared (upper limit) sound power levels:
  - 6.5 bels operating
  - 6.5 bels idle

These levels are measured in controlled acoustical environments according to the American National Standards Institute (ANSI) procedure S12.10 and ISO 7779, and are reported in accordance with ISO 9296. The declared sound power levels indicate an upper limit, below which a large portion of machines operate.

Heat Output

- Approximate heat output in British thermal units (Btu) per hour:
  - Minimum configuration: 1024 Btu
  - Maximum configuration: 2662 Btu

Safety Standards

- UL 1950
- CSA C22.2 No. 950-M93
- EN 60950 and countries deviations
- IEC 950
- NOM-019

- “SCSI Backplane Component Locations” on page 168.
- “Shuttle Assembly Removal” on page 169.
- “Working with Adapters” on page 173.
AC Power Assembly Removal

Before you begin:

Read “Safety Information” on page 226.

The AC power assembly is located in the rear of the system.

To remove the AC power assembly, do the following:

1. Power-off the system.
2. Disconnect all power to the system.
3. Remove the power AC power assembly screws 1
4. Pull the AC power assembly 2 out of the system.
Advanced System Management PCI Adapter Component Locations

The following simplified layout of the Advanced Remote Management Controller identifies the components.

1. 10/100 Ethernet port connector
2. Dual serial port connector
3. RS 485 bus connector
4. External power supply connector
5. PCMCIA token ring connector
6. Power on LED (CR2 bottom)
7. Processor error LED (CR2 top)
8. Ethernet activity LED (CR3 bottom)
9. Ethernet link LED (CR3 top)
10. I/O function card connector
11. Reserved J9
Battery
IBM has designed this product with your safety in mind. The lithium battery must be handled correctly to avoid possible danger. If you replace the battery, you must adhere to the following instructions.

⚠ Caution
When replacing the battery, use only IBM Part Number 33F8354 or an equivalent type battery recommended by the manufacturer. If your system has a module containing a lithium battery, replace it only with the same module type made by the same manufacturer. The battery contains lithium and can explode if not properly used, handled, or disposed of.

Do not:
- Throw or immerse into water
- Heat to more than 100°C (212°F)
- Repair or disassemble

Dispose of the battery as required by local ordinances or regulations.

---

Before you begin, be sure you have:
- Read “Safety Information” on page 226.
- Followed any special handling and installation instructions supplied with the replacement battery.

---

Note
After you replace the battery, you must reconfigure your server and reset the system date and time.
To replace the battery:

1. Turn off the server and peripheral devices and disconnect all external cables and power cords (see “Preparing to Install Options” on page 160); then remove the top cover (see “Removing the Top Cover” on page 161).

2. Remove the I/O function card from the server:
   a. Refer to the following illustration while you perform the steps in this procedure.

   ![Illustration of server components]

   b. Disconnect the cables 1 from the I/O function card 2. Note carefully where each cable is connected before you remove it.
   c. Remove the two screws 2 located on the metal connector plate inside the server.
   d. Carefully grasp the I/O function card by its top edge and pull the I/O function card out of the server.
   e. Place the I/O function card connector-side up on a flat, static-protective surface.

3. Locate the battery on the I/O function card (see “I/O Function Card Component Locations” on page 145).
4. Remove the battery:
   a. Use one finger to lift the battery clip over the battery.
   b. Use one finger to slightly slide the battery toward the rear of the I/O function card. The spring mechanism behind the battery will push it out toward you as you slide it forward.
   c. Use your thumb and index finger to pull the battery from under the battery clip.
   d. Ensure that the battery clip is touching the base of the battery socket by pressing gently on the clip.

5. Insert the new battery:
   a. Tilt the battery so that you can insert it into the front of the socket, under the battery clip.
   b. As you slide it under the battery clip, press the battery down into the socket.

6. Install the I/O function card:
   a. Carefully grasp the I/O function card by its top edge, and insert the tabs on the bottom edge of the metal connector plate in the matching openings on the server back panel.
   b. Align the I/O function card with the guide on the opposite end of the adapter and the slot on the I/O board.
   c. Press the I/O function card firmly into the slot.

   **Attention:** When you install the I/O function card in the server, be sure that it is completely and correctly seated. Incomplete insertion might cause damage to server components.
   d. Insert the two screws you removed in step 2c on page 90.
   e. Connect the cables you disconnected in step 2b on page 90.
7. Reinstall the top cover and complete the installation (see “Completing the Installation” on page 97).

8. Start the Configuration/Setup Utility program and reset configuration parameters as needed.
   - To reset the system date and time, go to “Date and Time” on page 28.
   - To reset the power-on password, go to “Using the Power-On Password Menu” on page 29.
   - To reconfigure your server, follow the instructions given in “The Configuration/Setup Utility Program” on page 25 (all models).
Changing Jumper Positions

Jumpers located on the I/O function card and processor board help you to customize the way your server operates.

Your I/O function card and processor board contain two-pin and three-pin jumper blocks. In some cases, groups of jumpers might combine to define a function.

Before you begin:

Read “Safety Information” on page 226.

To change a jumper position:

1. Remove the server top cover or front access cover, depending on the location of the jumper (see “Preparing to Install Options” on page 160).
2. If the jumper is located on the I/O function card, remove the I/O function card from the server:
   a. Refer to the following illustration while you perform the steps in this procedure.
   b. Disconnect the cables from the I/O function card. Note carefully where each cable is connected before you remove it.
   c. Remove the two screws located on the metal connector plate inside the server.
   d. Carefully grasp the I/O function card by its top edge and pull the I/O function card out of the server.
   e. Place the I/O function card connector-side up on a flat, static-protective surface.
3. Locate the jumper:
   • To change a two-pin jumper block, go to “Two-Pin Jumper Blocks” on page 94.
To change a three-pin jumper block, go to “Three-Pin Jumper Blocks” on page 95.

**Two-Pin Jumper Blocks:** Covering both pins with a jumper defines one function of the jumper block. To change the function of the jumper block, cover one pin only or remove the jumper entirely.

The following illustration identifies pins 1 and 2 on a two-pin jumper block.

![Two-pin jumper block illustration](image)

**To change the jumper position on a two-pin jumper block:**

1. Lift the jumper straight off the block and then do one of the following:
   - Align the holes in the bottom of the jumper with the two pins on the pin block, and then slide the jumper carefully onto these pins.

   ![Jumper alignment](image)

   - Align one of the holes in the bottom of the jumper with one of the pins on the pin block, and then slide the jumper carefully onto that pin only.
2. If you removed the I/O function card, install it:
   a. Refer to the illustration in step 2a on page 93 while you perform the steps in this procedure.
   b. Carefully grasp the I/O function card by its top edge, and insert the tabs on the bottom edge of the metal connector plate into the matching openings on the server back panel.
   c. Align the I/O function card with the guide on the opposite end of the adapter and the slot on the I/O board.
   d. Press the I/O function card firmly into the slot.
      **Attention:** When you install the I/O function card in the server, be sure that it is completely and correctly seated. Incomplete insertion might cause damage to server components.
   e. Insert the two screws you removed in step 2c on page 93.
   f. Connect the cables you disconnected in step 2b on page 93.

3. Reinstall the server top cover or front access cover and connect the cables (see “Completing the Installation” on page 97).

   **Three-Pin Jumper Blocks:** With the three-pin jumper blocks, each jumper covers two of the three pins on a pin block. You can position the jumper to fit over the center pin and either of the other two pins.

   The following illustration identifies pins 1, 2, and 3 on a three-pin jumper block:

   ![Three-pin jumper block illustration]

   To change the jumper position on a three-pin jumper block:
   1. Lift the jumper straight off the pin block.
   2. Align the holes in the bottom of the jumper with the center pin and the pin that was not covered previously.
3. Slide the jumper fully onto these pins.
4. If you removed the I/O function card, install it:
   a. Refer to the illustration in step 2a on page 93 while you perform the steps in this procedure.
   b. Carefully grasp the I/O function card by its top edge, and insert the tabs on the bottom edge of the metal connector plate into the matching openings on the back panel.
   c. Align the I/O function card with the guide on the opposite end of the adapter and the slot on the I/O board.
   d. Press the I/O function card firmly into the slot.

   **Attention**

   When you install the I/O function card in the server, be sure that it is completely and correctly seated. Incomplete insertion might cause damage to server components.

   e. Insert the two screws you removed in step 2c on page 93.
   f. Connect the cables you disconnected in step 2b on page 93.
5. Reinstall the server top cover or front access cover and connect the cables (see “Completing the Installation” on page 97).
Completing the Installation
Depending on the options you have installed, you must reinstall the top cover, the front access cover, and the front bezel to complete the installation. You must also reconnect all the cables that you disconnected in “Preparing to Install Options” on page 160, and, for certain options, run the Configuration/Setup Utility program. Follow the instructions in this section.

Installing the Top Cover: To install the server top cover:

1. Before installing a cover, check that all cables, adapters, and other components are installed and seated correctly and that you have not left tools or loose parts inside the server.
2. Lower the cover 2 with the rear edge of the cover about 25 mm (1 inch) back from the rear edge of the server.
3. Slide the cover forward.
4. Tighten the two thumbscrews 1 on the back edge of the cover.
5. If you disconnected any cables from the back of the server, reconnect the cables; then, plug the power cord into a properly grounded electrical outlet.
Notes

1. If you are in the United Kingdom and have a modem or fax machine attached to your server, reconnect the telephone line after you plug in the power cords.
2. If necessary, see “Input/Output Connectors and Expansion Slots” on page 121 for connector locations.

Installing the Front Access Cover:  To install the server front access cover:

1. Insert the bottom edge of the cover 1 in the matching openings in the server chassis.
2. Pivot the top of the cover into place and turn the quarter-turn fasteners 3 to the closed position 4.

Installing the Front Bezel:  To install the front bezel:

1. Insert the bottom edge of the bezel in the matching openings in the server chassis.
2. Pivot the top of the bezel until the latches snap into place.
Reconfiguring the Server: When you start your server for the first time after you add or remove an internal option or an external SCSI device, you might see a message telling you that the configuration has changed.

Some options have device drivers that you need to install. Refer to the documentation that comes with your option for information about installing any required device drivers.

If you have installed a new microprocessor, you might want to upgrade your operating system. Refer to the “Software and Netfinity Manager Reference” section of this Server Library.

Run the Configuration/Setup Utility program to save the new configuration information. See “The Configuration/Setup Utility Program” on page 25.
Connecting External Options

Before you begin:

- Read “Safety Information” on page 226.
- Read the documentation that comes with your options.

Connecting External SCSI Devices: You can attach a SCSI storage expansion enclosure to your server.

Cabling Requirements: If you plan to install external SCSI devices, you must order additional SCSI cables. These cables must have the proper connectors for the SCSI external connector and the external devices.

Refer to the information provided with your adapter to determine the number of internal and external connectors, channels, and SCSI devices that the adapter supports.

For information about the maximum length of SCSI cable between the terminated ends of the cable, see ANSI SCSI Standards:

- X3.131-1986 (SCSI)
- X3.131-1994 (SCSI-2)
- X3T10/1071D

Adhering to these standards ensures that your server operates properly.

Setting SCSI IDs for External Devices: Each SCSI device that is connected to a SCSI controller must have a unique SCSI ID, so that the SCSI controller can identify the devices and ensure that different devices do not attempt to transfer data at the same time. SCSI devices that are connected to different SCSI controllers can have duplicate SCSI IDs. Refer to “SCSI IDs” on page 137 and to the instructions that come with the SCSI devices for more information about setting a SCSI ID.

Installing External Devices: To attach an external device:

1. Run the shutdown procedure for the operating system. Turn off the server and all attached devices.
2. Follow the instructions that come with the option to prepare it for installation and to connect it to the server.
Input/Output Ports and Connectors: The input/output (I/O) connectors are for attaching external devices, such as printers, keyboards, and displays, to your server. The I/O connectors on your server include:

- Two serial-port connectors
- One parallel-port connector
- One video-port connector
- One keyboard-port connector
- One auxiliary-device-port connector
- One external UltraSCSI-port connector
- Two USB-port connectors
- One System Management 10/100 Ethernet port connector
- One dual serial-port connector
- One RS 485 bus connector

Refer to the illustration in “Input/Output Connectors and Expansion Slots” on page 121 for the locations of the connectors.

Serial Port: Your server comes with two serial ports. (Refer to “Input/Output Connectors and Expansion Slots” on page 121 for the locations of the connectors.) These ports are used to communicate with printers, plotters, external modems, scanners, and auxiliary terminals. You can also use these ports to transfer data between computers.

Serial ports transfer data one bit at a time, using direct memory access (DMA). DMA is a method of transferring data between I/O devices and system memory without intervention by the system microprocessor.

Serial ports can transfer data asynchronously, which means that they can transmit any number of characters at any time, with no restriction on the duration of the pauses between characters.

The serial ports can transmit and receive data and commands at rates of from 300 bits per second up to 345,600 bits per second. To use a serial port at 345,600 bits per second, you need a shielded serial cable.

Each serial port has a 9-pin, male D-shell connector on the back of the server. The pin-number assignments of this connector conform to the industry standard.
The following table shows the pin-number assignments for the serial-port connectors.

<table>
<thead>
<tr>
<th>Pin</th>
<th>Signal</th>
<th>Pin</th>
<th>Signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Data carrier detect</td>
<td>6</td>
<td>Data set ready</td>
</tr>
<tr>
<td>2</td>
<td>Receive data</td>
<td>7</td>
<td>Request to send</td>
</tr>
<tr>
<td>3</td>
<td>Transmit data</td>
<td>8</td>

<tr>
<td>4</td>
<td>Data terminal ready</td>
<td>9</td>
<td>Ring indicator</td>
</tr>
<tr>
<td>5</td>
<td>Signal ground</td>
<td>-----</td>
<td>------------------</td>
</tr>
</tbody>
</table>

When you turn on your server, the POST routine assigns the serial ports to specific communication port addresses.

Some application programs use only certain ports, and some modems are designed for use only at certain communication port addresses. You might need to use the Configuration/Setup Utility program to change communication port address assignments to resolve conflicts.

**Parallel Port:** The parallel port usually is used to communicate with printers, and transfers data one byte at a time using DMA. The parallel port has a 25-pin, female D-shell connector on the back of your server. (Refer to “Input/Output Connectors and Expansion Slots” on page 121 for the location of the connector.)

The following table shows the pin-number assignments for the parallel-port connector.

<table>
<thead>
<tr>
<th>Pin</th>
<th>Signal</th>
<th>Pin</th>
<th>Signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>STROBE</td>
<td>14</td>
<td>AUTO FEED XT</td>

</tr>
<tr>
<td>12</td>
<td>PE (paper end)</td>
<td>25</td>
<td>Ground</td>
</tr>
<tr>
<td>13</td>
<td>SLCT (select)</td>
<td>-----</td>
<td>----------------------</td>
</tr>
</tbody>
</table>

When you turn on your server, the POST routine assigns the parallel port a specific port address. You can change the parallel-port assignment by using the Configuration/Setup Utility program.
**Video Port:** The I/O function card in your server has one SVGA video port. This port is used to attach a video monitor. The video port has a 15-pin analog connector on the back of the server. (Refer to “Input/Output Connectors and Expansion Slots” on page 121 for the location of the connector.)

The following table shows the pin-number assignments for the video connector.

<table>
<thead>
<tr>
<th>Pin</th>
<th>Signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Red</td>

</tr>
</tbody>
</table>
**Keyboard and Auxiliary-Device Ports:** The I/O function card has one keyboard port and one auxiliary-device port that supports a mouse or other pointing device. (Refer to "Input/Output Connectors and Expansion Slots" on page 121 for the locations of the connectors.)

The following table shows the pin-number assignments for the connectors used by the keyboard and auxiliary-device ports.

<table>
<thead>
<tr>
<th>Pin</th>
<th>Signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Data</td>
</tr>
<tr>

<tr>
<td>4</td>
<td>+5 V DC</td>
</tr>
<tr>
<td>5</td>
<td>Clock</td>
</tr>
<tr>
<td>6</td>
<td>Not connected</td>
</tr>
</tbody>
</table>
**UltraSCSI Ports:** Your server has two UltraSCSI bus-master controllers on the I/O function card; one supports internal devices and the other is connected to an external connector for support of external devices. Each controller supports up to 15 SCSI devices. You can use the 68-pin, SCSI connectors for these controllers to expand the capabilities of your server by attaching different types of SCSI devices, such as drives or printers.

Table 5 shows the pin-number assignments for the 68-pin SCSI connectors.

Universal Serial Bus Ports: The I/O board in your Netfinity 7000 M10 contains two universal serial bus (USB) ports. Each USB port has an external connector on the rear on the server for attaching devices that previously used serial, parallel, keyboard, mouse, and game ports.

USB is an emerging serial interface standard for telephony and multimedia devices. USB technology uses Plug and Play to determine what device is attached to the connector. Each USB device is accessed by a unique USB address. A device called a hub is used to convert the USB port into multiple attachment points. A hub has multiple ports where devices can be attached. USB provides 12 megabits-per-second (Mbps) data transfer rate with a maximum of 63 devices and a maximum signal distance of 5 meters (16 ft.) per data segment.

Note
If more than one USB device is to be attached, the device must be connected to a hub.

Table 6 shows the pin-number assignments for the USB connectors.

10/100 Ethernet Port: The Advanced Remote Management Controller contains a 10/100 Ethernet controller. The Ethernet controller has an external RJ-45 connector that is used with category 3, 4, or 5 unshielded twisted-pair (UTP) cable. The connector enables your Advanced Remote Management Controller to attach to an Ethernet network for remote communication.

Notes
1. The 10/100 Ethernet port cannot be accessed from the network operating system. The connector is dedicated to connecting your Advanced Remote Management Controller to an Ethernet network through a service-processor interface, such as Netfinity Manager.
2. The 100BASE-TX Fast Ethernet standard requires that the cabling in the network is Category 5 or higher.

Table 7 on page 108 shows the pin-number assignments for the RJ-45 connector. These assignments apply to both 10BASE-T and 100BASE-TX devices.
Dual Serial Port: The Advanced Remote Management Controller contains a dual serial port. The port has an external connector that can be used to attach to a Y-cable that is shipped with your server. The serial connectors on the Y-cable and the pin-number assignments are the same as for the system serial ports. This Y-cable can be used to attach to a modem that is dedicated to communication with the Advanced Remote Management Controller.

RS 485 Bus Port: The Advanced Remote Management Controller contains an RS 485 port. The port has an external connector that must be attached to an optional Y-cable that provides for chaining other compatible System Management Adapters for remote access.

The following table shows the pin-number assignments for the connectors used by the RS 485 bus port.

Controls and Indicators
The most commonly used controls and indicators on the front of the server appear in the following illustration.

1. **Next Button**: Press this button to highlight an action to perform on a system monitoring message; then, press the Enter button to select the action. You can select:
   - **Keep** to retain the message on the information panel and enable the system error light to continue to flash
   - **Remind** to retain the message on the information panel and enable the system error light to flash slowly
   - **Clear** to clear the message from the information panel and enable the system error light to stop flashing

2. **Enter Button**: Press this button to select an action to perform on system monitoring messages that appear on the information panel.

3. **Hard Disk Status Light**: Each of the hot-swap drives has a Hard Disk Drive Status light. When the amber light for a hard disk drive is lit continuously, the drive has failed. When the light flashes slowly (one flash per second), the drive is being rebuilt. When the light flashes rapidly (three flashes per second), the controller is identifying the drive.
4 **Hard Disk Activity Light:** Each of the hot-swap drives has a Hard Disk Activity light. When the green light for a hard disk drive is flashing, the drive is being accessed.

5 **CD-ROM Eject/Load Button:** Press this button to eject or retract the CD-ROM tray so that you can insert or remove a CD.

6 **CD-ROM Drive In-Use Light:** When this light is lit, the CD-ROM drive is being accessed.

7 **Diskette-Eject Button:** Press this button to eject a diskette from the drive.

8 **Diskette Drive In-Use Light:** When this light is lit, the diskette drive is being accessed.

9 **Power Control Button:** Press this button to manually turn the server on or off.

---

**Caution**

The Power Control button on the front of the server does not turn off the electrical current supplied to the server. The server also might have more than one power cord. To remove all electrical current from the server, ensure that all power cords are disconnected from the power source.

The server can be activated in several ways:

- You can turn the server on by pressing the Power Control button on the front of the server.
- If the server is activated and a power failure occurs, the server will start automatically if the automatic-restart-after-power-failure feature is selected in the Configuration/Setup Utility program.
- The server can also be powered on by the Advanced Remote Management Controller.

The server can be deactivated as follows:

- You can turn the server off by pressing the Power Control button on the front of the server. Pressing the Power Control button starts an orderly shutdown of the operating system, if this feature is supported by the operating system, and places the server in standby mode.
After turning off the server, wait at least five seconds before pressing the Power Control button to power on the server again.

- Pressing and holding the Power Control button causes an immediate shutdown of the server, and places the server in standby mode. This feature can be used if the operating system hangs.
- Disconnecting the server power cord from the electrical outlet will shut off all power to the server.

Wait about 15 seconds after disconnecting the power cord for your system to stop running. Watch for the System Power light on the information LED panel to stop flashing.

**Note**

**Reset Button:** Press this button to reset the system and run the power-on self-test (POST).

**Information LED Panel:** The lights on this panel give status information for your server. See “Information LED Panel” on page 120 for more information.
Hot-Swap Fan Assembly
Your server comes with two hot-swap fan assemblies in the front access cover and two hot-swap fan assemblies behind the hot-swap drive bays.

Notes
1. You do not need to turn off the power to the server to replace a fan assembly.
2. Replace a fan assembly that has failed as soon as convenient to maintain the redundant cooling capability.

To replace a hot-swap fan assembly:

Caution
The power cable to the fan should be disconnected whenever the fan assembly is not installed in the server; otherwise, the fan might start turning while you are holding it and the fan blades could injure your fingers.

1. Determine which fan assembly you will replace.
   - To replace a fan assembly behind the hot-swap drive bays, go to step 2.
   - To replace a fan assembly in the front access cover, go to step 6 on page 113.
2. To replace a fan assembly behind the hot-swap drive bays, remove the top cover (see “Removing the Top Cover” on page 161).
3. Pull on the fastener 1 and remove the fan assembly from the server.

4. Insert the replacement fan assembly in the server. Align the bottom edge of the fan assembly with the matching openings in the server chassis.

5. When you have the fan assembly correctly seated, press on the fastener to secure the fan assembly in the server.

   **Note**
   The power cable engages and the fan blades begin to spin when you correctly seat the fan assembly in the chassis.

6. To replace a fan assembly in the front access cover, remove the front bezel (see “Removing the Front Bezel” on page 163).

7. Pull on the fastener and remove the fan assembly 1 from the front access cover.

8. Insert the replacement fan assembly in the front access cover. Align the bottom edge of the fan assembly 2 with the matching openings in the front access cover.

9. When you have the fan assembly correctly seated, press on the fastener to secure the fan assembly.

   **Note**
   The power cable engages and the fan blades begin to spin when you correctly seat the fan assembly.

10. If you have other options to install or remove, do so now; otherwise, go to “Completing the Installation” on page 97.
Hot-Swap Power Supplies
The following illustration shows the power supplies in your server.

**Note**
Your server may differ slightly from the following illustration, depending on your model.

---

1. **Filler Panels:** You can remove these filler panels to install additional power supplies.

2. **Hot-Swap Power Supplies:** See “Hot-Swap Power Supply Installation” on page 115 for information on power supply requirements and for instructions on installing additional power supplies.

3. **Power-Supply Power Switch:** This switch turns the power supply on and off.

4. **AC Power Light:** This light provides status information about the power supply. For normal operation, both the AC and DC Power lights should be on. For any other combination of lights, see “Power Supply LEDs” on page 17.

5. **DC Power Light:** This light provides status information about the power supply. For normal operation, both the AC and DC Power lights should be on. For any other combination of lights, see “Power Supply LEDs” on page 17.
Hot-Swap Power Supply Installation

Notes

1. If your server comes with one power supply, install a second power supply if you install one or more of the following:
   - Two microprocessors (3 or 4 total)
   - Optional memory board
   - Six or more PCI adapters
2. If a second power supply is not a requirement, a second power supply provides redundancy.
3. If a second power supply is a requirement, a third power supply provides redundancy.

After you install a power supply, check the power-supply status indicators to verify that the power supply is operating properly. See “Power Supply LEDs” on page 17 for details.

Notes

1. Turn the power switch on the power supply.
2. Facing the read of the system, always add power supplies form left to right.

Caution

Never remove the cover on a power supply or any part (power backplane and AC box) that has the following label attached.

Hazardous voltage, current, and energy levels are present inside the power supplies, power backplane, and AC box. There are no serviceable parts inside the power supplies, power backplane, or AC box.

Refer to the following illustration while performing the steps in this procedure.

Note

Your server may differ slightly from the following illustration, depending on your model.
Caution

Never remove the cover on a power supply or any part (power backplane and AC box) that has the following label attached.

Hazardous voltage, current, and energy levels are present inside the power supplies, power backplane, and AC box. There are no serviceable parts inside the power supplies, power backplane, or AC box.
To add a power supply:

**Note**

It is not necessary to turn the Power switch on the power supply off when you are installing a hot-swap power supply.

1. Remove the filler panel:
   a. Remove the screws from the filler panel.
   b. Remove the filler panel from the power-supply bay and save it and the screws for future use.

**Note**

During normal operation, be sure that each power-supply bay has either a power supply or filler panel installed for proper cooling.

2. Remove any shipping screws from the power supply.

**Note**

You do not need to replace the shipping screws.

3. Place the handle on the power supply in the open position, and slide the power supply into the chassis.
4. Close the handle on the power supply to seat the power supply in the bay.
5. Make sure the Power switch on the power supply is in the On position.
6. Verify that the DC Power light and AC Power light on the power supply are lit, indicating that the power supply is operating correctly.
Hot-Swap Power Supply Removal
Refer to “Hot-Swap Power Supply Installation” on page 115 for information on power supply requirements. Each power supply has two status indicators; see “Power Supply LEDs” on page 17 for information about the status indicators.
Refer to the illustration in “Hot-Swap Power Supply Installation” on page 115 while you perform the steps in this procedure.

Caution
Never remove the cover on a power supply or any part (power backplane and AC box) that has the following label attached.

![Caution Label]

Hazardous voltage, current, and energy levels are present inside the power supplies, power backplane, and AC box. There are no serviceable parts inside the power supplies, power backplane, or AC box.
To remove a hot-swap power supply:

1. If your server has only two functioning power supplies and requires both (see “Hot-Swap Power Supply Installation” on page 115), turn off the server and peripheral devices (see “Preparing to Install Options” on page 160); otherwise, go to the next step.

   **Attention**

   Before removing a functional power supply, set the Power switch on the power supply to the Off position.

2. Set the Power switch on the power supply that you are removing to the Off position.

3. Remove the power supply:
   a. Remove any shipping screws from the power supply.

      **Note**

      You do not need to replace the shipping screws.

   b. Pull the handle on the power supply; then, slide the power supply out of the chassis.

      **Note**

      During normal operation, be sure that each power-supply bay has either a power supply or filler panel installed for proper cooling.

4. If you are not installing a replacement power supply, install a power-supply filler panel 2; then go to step 5.

   If you are replacing the power supply:
   a. Place the handle 4 on the power supply in the open position, and slide the power supply into the chassis.
   b. Close the handle on the power supply to seat the power supply in the bay.
   c. Make sure the Power switch on the power supply is in the On position.
   d. Verify that the AC Power light and DC Power light are lit, indicating that the power supply is operating correctly.

5. If you have other options to install or remove, do so now; otherwise, go to “Completing the Installation” on page 97.
Information LED Panel
The information LED panel on the front of the server contains status lights.

1. **System Error Light**: This amber light is lit when a system error occurs. Information about the condition will display on the Information Panel.

2. **Information Panel**: System monitor information appears on this vacuum fluorescent display (VFD). The Advanced Remote Management Controller monitors system functions and generates the messages. See “System Management Codes” on page 208 for more information.

   When the server is in standby mode (the system power supply is turned off and AC current is present) the information panel can display system monitor information.

3. **System Power Light**: When this light is lit, system power is present in the server. When this light flashes, the server is in standby mode (the system power supply is turned off and AC current is present). When this light is off, it indicates either power supply failure or an AC power failure.

   **Attention**: If this light is off, it does not mean there is no electrical current present in the server. To remove all electrical current from the server, you must unplug the server power cord from the electrical outlet.

4. **SCSI Hard Disk Drive Activity Light**: This green light is lit when there is activity on a hard disk drive.
Input/Output Connectors and Expansion Slots
The following illustration shows the expansion slots and the input/output connectors (ports) on the rear of the server.

1. **External Connector Knockout:** Your server has an external connector knockout that can be used when you install the token-ring system management adapter option.

2. **SCSI Connector:** External SCSI devices attach here.

3. **Serial A Connector:** Serial signal cables for modems and other serial devices connect here to the 9-pin serial port A connector. See “Devices and I/O Ports” on page 27 for port assignment information. If you are using a 25-pin signal cable, you need a 9-pin-to-25-pin adapter cable.

4. **10/100 Ethernet Connector:** This connector is to attach the Advanced Remote Management Controller to a network hub for remote communication.

   **Note**
   The 10/100 Ethernet connector cannot be accessed from the network operating system. The connector is dedicated to connecting your Advanced Remote Management Controller to an Ethernet network through a service-processor interface, such as Netfinity Manager.
Serial B Connector: Serial signal cables for modems and other serial devices connect here to the 9-pin serial port B connector. See “Devices and I/O Ports” on page 27 for port assignment information. If you are using a 25-pin signal cable, you need a 9-pin-to-25-pin adapter cable.

Dual Serial Connector: This connector can be used to attach to a Y-cable that is shipped with your server. This Y-cable can be used to attach to a modem that is dedicated to communication with the Advanced Remote Management Controller.

RS 485 Bus Connector: This connector is used to attach other compatible system management adapters for remote access.

Parallel Connector: A signal cable for a parallel device, such as a printer connects here.

Video Connector: The monitor signal cable connects here.

Universal Serial Bus Connectors: You can attach I/O devices to these two universal serial bus (USB) connectors. You need a 4-pin cable to connect devices to USB 1 or 2. A hot-plug keyboard-and-mouse option can be cabled or uncabled from the USB connectors without error or loss of service.

Note
If a standard (non-USB) keyboard is attached to the keyboard port, the USB ports are disabled while the power-on self-test (POST) is running and no USB devices will work during POST.

Power Supply Connector: The system power cord connects here.

Attention Lights for PCI Slots: Each PCI slot has an Attention light that is visible from the rear of the server. An Attention light flashes approximately once per second when it is on. The meaning of the Attention lights is defined by your operating system. Refer to your operating-system documentation to determine if the operating system supports hot-plug PCI adapters and, if so, what the Attention lights indicate.

PCI Expansion Slots: Your server has seven 32-bit and five 64-bit peripheral component interconnect (PCI) expansion slots. All PCI slots support hot-plug PCI adapters.
You can install PCI adapters to provide communication, specialized graphics, and sound. Many adapters provide bus-master capabilities,
which enable the adapters to perform operations without interrupting the system microprocessors.

14 **Keyboard Connector:** The keyboard cable connects here.

15 **Mouse Connector:** The mouse cable connects here. This port sometimes is called an auxiliary-device or pointing-device port.

**Note**

For pin assignments and other details about these connectors, see “Connecting External Options” on page 100.
Installing and Removing the Server from a Rack

During the installation procedure, you must install parts on the rack and the server. This process can be divided into two parts:

- Preparing the rack
- Installing the server in the rack

Preparing the Rack

Caution

Use safe lifting practices when lifting your machine.

In this section, you will use the following parts:

- IBM installation template
- Two slide-bracket assemblies
- One cable-management arm
- One server bracket (for attaching the cable-management arm to the server)
- Four lift handles
- Sixteen long screws (M6 by 16 mm)
- Eight short screws (M4 by 8 mm)
- Six cage nuts
- Four nut bars
- Two hex nuts (M6)
To ensure rack stability, plan the installation of servers in the rack starting from the bottom.

To attach the mounting hardware to the rack:

1. Remove the rack front door. Refer to the rack documentation for instructions.
2. Mark the positions of the slide-bracket assemblies, bezel brackets, and the cable-management arm on the rack:
   a. Position the installation template on the front mounting rails on the rack, aligning the holes.
   b. Mark the holes for the slide-bracket assemblies and bezel brackets.
   c. Move the template to the same U level at the rear of the server and mark the locations for the slide-bracket assemblies and cable-management arm.
   d. Install the six cage nuts at the locations marked on the mounting rails for the cable-management arm and bezel brackets.
3. Attach a slide-bracket assembly to the front of the rack:
   a. Position the slide-bracket assembly behind the mounting rail so that the slides will extend out from the front of the rack.
**Notes**

1. Get another person to help you attach the slide-bracket assemblies to the rack.
2. The slide-bracket assemblies can be installed on either the left or right side of the rack.
3. Refer to the illustrations for examples of the proper alignment of the slide-bracket assemblies.

b. If necessary, loosen the screws at the rear of the slide-bracket assembly and adjust the length of the slide bracket to fit the mounting rail. Tighten the screws.

c. Position a nut bar behind the slide-bracket assembly.

d. Insert two screws (M6 by 16 mm) through the mounting rail, slide-bracket assembly, and nut bar. Do not tighten the screws.
4. Attach the slide-bracket assembly to the rear of the rack:
   a. Position the slide-bracket assembly inside the mounting rail.
   b. Position a nut bar behind the slide-bracket assembly.
   c. Insert two screws (M6 by 16 mm) through the mounting rail, slide-bracket assembly, and nut bar. Do not tighten the screws.

5. Attach the other slide-bracket assembly to the front and rear of the rack.
6. Push the slide-bracket assemblies to the outermost positions on the rack.

7. Tighten all screws to secure both slide-bracket assemblies. If you are using a torque screwdriver, use the following torque setting:
     8–11 Nm (70.8–97.0 in/lbs).

8. Attach the cable-management arm to the rear of the rack:
   a. Position the cable-management arm bracket on the outside of the mounting rail.
   b. Insert two screws (M6 by 16 mm) through the cable-management arm bracket, mounting rail, and cage nuts. Tighten the screws.

   c. Position the server bracket on the cable-management arm.
d. Insert two screws (M6 by 16 mm) through the cable-management arm and the server bracket. Tighten the screws.
Installing the Server in the Rack:  In this section, you will use eight screws (M4 by 8 mm) and four screws (M6 by 16 mm).

To install the server in the rack:
1. Fully extend the slide-bracket assemblies until they lock.
2. Install the four lift handles on the sides of the server.
   a. Press in on the sides of the lift handle near the tabs and insert the handle tabs into the slots on the sides of the server.
   b. Move the handle up in the slots so that the hooked part of each tab is inside the server.
   c. Release the pressure on the sides of the handle.
   d. Install the remaining three lift handles.

Caution
Use safe lifting practices when lifting your machine.

3. Lift and position the server so that the bayonet slots on the server are above the bayonets on the slide-bracket assemblies.
4. Lower the server and slip the bayonets into the bayonet slots.
5. Remove the four lift handles from the sides of the server:
   a. Grasp the lift handle and press in on the sides of the lift handle near the tabs until the tabs touch the inside edges of the slots.
   b. Move the handle down in the slots so that the hooked parts of the tabs clear the top edges of the slots; then, pull the handle away from the server.
   c. Remove the remaining three handles. Store the handles in a safe place.
6. Insert four screws (M4 by 8 mm) through one slide-bracket assembly and server side. Tighten the screws. Repeat this step for the other slide-bracket assembly on the opposite side of the server. This secures the server.

   **Note**
   When the drawer is fully extended, safety latches on the slide-brackets lock into place. To release the safety latch, press the latch on each side of the rack.

7. Press the safety latches and slide the drawer about halfway into the rack.

8. Attach the cable-management arm to the server using the captive screws.
9. Attach the monitor, keyboard, and power cables to the corresponding connectors on the server. Refer to the rack documentation for instructions.

10. Attach the cables to the cable-management arm using cable ties.

11. Secure the server in the rack:
   a. Slide the drawer into the rack.
   b. Secure the server to both sides of the rack by inserting two screws (M6 by 16 mm) through the bezel brackets, mounting rails, and cage nuts.

   **Note**

   Depending on your model, the bezel brackets might have only one screw hole for attaching the server to the rack.
12. Install the rack front door.
13. To complete the installation, refer to the documentation that comes with the rack.
Removing the Server from a Rack

Before you begin

- Read “Safety Information” on page 226.
- Turn off the server.
- Follow any additional installation and safety instructions that come with the rack.

To remove the server from a rack:

1. If you have a modem or fax machine attached to the server, disconnect the telephone line from the electrical outlet and the server.

   **Note**
   
   If you are in the United Kingdom, you must perform this step before disconnecting the power cord.

2. Disconnect all cables and power cords from the rear of the server.
3. Disconnect all power cords from the rack.
4. Remove the screws from the bezel brackets on each side of the front bezel. Set them aside for later use.
5. Slide the server about halfway out of the rack.
6. Loosen the captive screws that secure the cable-management arm.
7. Fully extend the slide-bracket assemblies until they lock.
8. Remove the screws that attach the server to each slide-bracket assembly.

   **Caution**
   
   Use safe lifting practices when lifting your machine.

9. Install the four lift handles on the sides of the server.
   a. Press in on the sides of the lift handle near the tabs and insert the handle tabs into the slots on the sides of the server.
   b. Move the handle up in the slots so that the hooked part of each tab is inside the server.
   c. Release the pressure on the sides of the handle.
   d. Install the remaining three lift handles.
10. Lift the server from the slide bracket assemblies and place the server on a flat, nonconductive surface.

Disassembling the Drawer Hardware: If you are not going to reinstall the server or install another drawer model, remove the brackets from the server and the rack.

1. Remove Save the slide-bracket assemblies and screws for future use.
2. Remove the chassis brackets from the sides of the server.
3. Remove the screws that attach the left slide rail to the front and rear mounting rails.
4. Remove the screws that attach the right slide rail to the front mounting brackets.
5. Remove the screws that attach the slide rail and cable-management arm to the rear of the rack.
6. Refer to the documentation that comes with the rack for additional instructions.
**Internal Drives Installation**

Different types of drives allow your system to read multiple types of media and store more data. Several types of drives are available, such as:

- Diskette
- Hard disk
- CD-ROM
- Tape

**Internal Drive Bays:** Internal drives are installed in bays. Your server comes with one 3.5-inch, 1.44 MB diskette drive and one CD-ROM drive.

Your server contains hardware that lets you replace a failed hard disk drive without turning off the server. Therefore, you have the advantage of continuing to operate your system while a hard disk drive is removed or installed. These drives are known as *hot-swappable* drives. They are also referred to as hot-swap drives.

Each hot-swap drive bay has two indicator lights on the front of the server (see “Controls and Indicators” on page 109). If the amber Hard Disk Status light for a drive is lit continuously, that individual drive is defective and needs to be replaced. When the Hard Disk Status light indicates a faulty drive, you can replace a hot-swap drive without turning off the server.

Each hot-swap drive that you plan to install must have a hot-swap-drive tray attached. The drive must have a single connector attachment (SCA) connector. Hot-swap-drive trays come with the hot-swap drives.

- Your server comes with a preinstalled 3.5-inch, 1.44 MB diskette drive and a preinstalled IDE CD-ROM drive.
The Netfinity 7000 M10 supports one diskette drive only.

Your server supports four slim-high (1-inch) or two half-high (1.6-inch), 3.5-inch hot-swap hard disk drives in the hot-swap bays.

The hot-swap bays connect to a SCSI backplane. This backplane is the printed circuit board behind the bay. The backplane supports up to four hard disk drives.

The diskette drive uses 1 MB and 2 MB diskettes. For optimum use, format 1 MB diskettes to 720 KB and format 2 MB diskettes to 1.44 MB.

**SCSI Drives:** Some drives have a special design called small computer system interface, or SCSI. This design allows you to attach multiple drives to a single SCSI connector.

---

**Notes**

1. Any information about SCSI drives also applies to other SCSI devices, such as tape drives.
2. If you plan to install both internal and external SCSI devices, you must follow the instructions in “Connecting External Options” on page 100, in addition to the instructions in this section.

---

A 16-bit (wide) SCSI cable connects the hot-swap backplane to one channel of the integrated SCSI controller on the I/O function card.

**SCSI IDs:** Each SCSI device that is connected to an individual integrated SCSI controller needs a unique identification (ID) so that the controller can identify the devices and ensure that different devices do not attempt to transfer data at the same time. (The integrated SCSI controllers operate independently.) If you need to set IDs for SCSI devices, refer to the instructions that come with those devices.

Your server automatically sets SCSI IDs for hot-swap hard disk drives, according to the jumper settings on the SCSI backplane. The server uses the hard disk drive SCSI IDs to send status information to the indicator lights above each hot-swap bay.

---

**Note**

Do not set the SCSI ID jumpers on hard disk drives.

The SCSI backplane in the server supports up to four hot-swap drives. Table 9 on page 138 shows the default SCSI IDs that the backplane assigns for hot-swap hard disk drives.
The processing sequence for SCSI devices is set through the SCSI Select Utility program. The default sequence proceeds from the lowest SCSI ID to the highest (0 to 6, then 8 to 15).

**Termination:** The devices at both ends of the SCSI bus must be terminated. If you attach SCSI devices (internal or external), you must terminate the last device in the chain. The SCSI cable that comes in your server (connected to the SCSI backplane) is terminated. All the hot-swap drives in your server have automatic termination.

Refer to the information that comes with the SCSI device for instructions about setting device jumpers or switches that control termination.

**Preinstallation Steps:** Before you install drives in your server, verify that you have all the cables and any other equipment specified in the documentation that comes with the internal drive. You might also need to perform certain preinstallation activities. Some of the steps are required only during the initial installation of an option.

1. Choose the bay in which you want to install the drive.
2. Check the instructions that come with the drive to see if you need to set any switches or jumpers on the drive. Remove any SCSI ID jumpers from the drive.
3. To install the drive, go to “Installing a Drive in a Hot-Swap Bay.”

**Installing a Drive in a Hot-Swap Bay:** The bays on the right front of the server support hot-swap drives only.

---

**Note**

You do not have to turn off the server to install hot-swap drives in these bays. However, you must turn off the server when performing any steps that involve installing or removing cables.

---

**Before you begin:**

- Read “Safety Information” on page 226.
- Read the documentation that comes with your drive.

---

<table>
<thead>
<tr>
<th>Bay</th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
</tr>
</tbody>
</table>

*Note:* The default SCSI ID for the SCSI backplane is 14. The default SCSI ID for each SCSI controller is 7.
To install a drive in a hot-swap bay:

1. Determine the bay in which you want to install the drive.
2. Remove the filler panel from the empty hot-swap bay by inserting your finger into the depression at the left side of the filler panel and pulling it away from the server.
3. Install the hard disk drive in the hot-swap bay:
   a. Ensure the tray handle is open (that is, perpendicular to the drive).
   b. Align the drive/tray assembly so that it engages the guide rails in the bay.
   c. Gently push the drive assembly into the bay until the drive connects to the backplane.
   d. Push the tray handle to the right until it locks.
4. Check the hard disk drive status indicators to verify that the hard disk drives are operating properly. See “Identifying Problems through Status Indicators” on page 16 for details.

**Note**

If your server has a RAID adapter installed, refer to the RAID adapter documentation for details about configuration requirements.

Replacing a Drive in a Hot-Swap Bay

**Note**

You do not have to turn off the server to remove a drive from a hot-swap bay.
If the amber Hard Disk Status light for a drive is lit continuously, that individual drive is defective and needs to be replaced.

**Attention**

1. Before you hot-swap a drive, make sure it is defective. If you partially or completely remove a good drive instead of a defective one, your server might lose valuable data. If your server has a RAID adapter installed and you assigned RAID level 1 or 5 to the logical drives in your disk array, make sure the drive is defective. However, the RAID adapter can rebuild the data that you need, provided that certain conditions are met. Refer to the RAID adapter documentation for further details.

2. To avoid damage to a hard disk drive, DO NOT remove the drive from the hot-swap bay until it has had time to spin down (approximately 30 seconds). Handle the drive gently.

**Before you begin:**

- Read “Safety Information” on page 226.
- Read the documentation that comes with your drive.
- Prepare the drive for installation (see “Preinstallation Steps” on page 138).
To replace a drive in a hot-swap bay:

Refer to the illustration in “Installing a Drive in a Hot-Swap Bay” on page 138 while you perform the steps in this procedure.

1. Remove the defective hard disk drive by pressing on the lock to release the handle, placing the handle in the open position (perpendicular to the drive), and pulling the hot-swap tray from the bay.

2. Install the hard disk drive in the hot-swap bay:
   a. Ensure the tray handle is open (that is, perpendicular to the drive).
   b. Align the drive/tray assembly so that it engages the guide rails in the bay.
   c. Push the drive assembly into the bay until the drive connects to the backplane.
   d. Push the tray handle to the right until it locks.

3. Check the hard disk drive status indicators to verify that the hard disk drives are operating properly. See “Identifying Problems through Status Indicators” on page 16 for details.
I/O Board Component Locations

A simplified layout of the I/O board is shown in the following illustration.

1. System Reset jumper J8
   (Same as front panel reset)
2. Force PCI power-on for slot 11 jumper J9
   For use with PCI cards without PCI presence detect)
3. Force System Power jumper J7
   (With jumper installed, will power-on regardless of state of front panel)
4. IDE connector
5. System-management adapter slot
6. USB 1 and USB 2 port connectors
7. I/O function card slot
8. Hot-plug 32-bit PCI slots 11–12 (bus C)
9. Hot-plug 32-bit PCI slots 6–10 (bus B)
10. Hot-plug 64-bit PCI slots 1–5 (bus A)
11. Attention LED for PCI slot
12. Attention LED for PCI slot
13. Power LED for PCI slot
14. I/O Board LEDs (see “I/O Board LEDs” on page 143.)
I/O Board LEDs
A simplified layout of the section of the I/O board containing the LEDs is shown in the following illustration.

1. 32 Bit Slot Reset LED (Slots 6-10)
2. SMI LED
3. Power Supply Power Good LED
4. Reserved
5. System Power Good LED
6. 64 Bit Slot Reset LED (Slots 1-5)
7. System NMI LED
8. Secondary PCI Bus SERR (adaptec, system management card, video)
9. 32 Bit Slot Reset LED (Slots 11-12)
10. Secondary PCI Bus PERR (adaptec, system management card, video)
11. SERR on 64 Bit PCI (slots 1-5)
12. PERR on 64 Bit PCI (slots 1-5)
13. PERR on 32 Bit PCI (slots 11-12)
14. PERR on 32 Bit PCI (slots 6-10)
15. SERR on 32 Bit PCI (slots 6-10)
16. SERR on 32 Bit PCI (slots 11-12)
I/O Board Removal

Before you begin:

Read “Safety Information” on page 226.

Note

Be sure to update the BIOS to the latest level when replacing this FRU.

To Remove the I/O board, do the following:

1. Power-off the system.
2. Disconnect all power to the system.
3. Remove the top cover, see “Removing the Top Cover” on page 161.
4. Disconnect all I/O board cables.
5. Disconnect all cables attached to adapters installed on the I/O board, then, remove the adapters.
6. Remove the shuttle assembly, see “Shuttle Assembly Removal” on page 169.
7. Remove the twelve I/O board screws 1.
8. Remove the I/O board retainer 2 and lift the I/O board out of the server.
I/O Function Card Component Locations
The following simplified layout of the I/O function card identifies the components.

1. External SCSI connector (channel A)
2. Battery
3. Internal SCSI connector (channel B)
4. Operator panel connector
5. Diskette drive connector
6. Password override jumper (J17)
7. Flash page swap jumper (J16)
8. Parallel port connector
9. Video port connector (The video port connector is behind the parallel port connector)
10. Serial port A and B connectors
11. Keyboard and mouse connectors (The keyboard connector is behind the mouse connector)
12. Advanced Remote Management Controller connector
I/O Function Card Jumpers

Table 10 describes the jumpers on the I/O function card. The highlighted numbers in the table correspond to the highlighted numbers on the illustration in “I/O Function Card Component Locations” on page 145.

**Note**

Turn off the server, and disconnect the power cord before moving any jumpers.

<table>
<thead>
<tr>
<th>Jumper Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| J17 Power on password override | Changing the position of this jumper bypasses the power-on password check. You do not need to move the jumper back to the default position after the password is overridden. To do this:  
1. Shut down and power-off the system.  
2. Move jumper J17; then, power-on the system. POST will clear the password.  

**Note**  
Changing the position of this jumper does not affect the administrator password. If the administrator password is set, you must replace the I/O board. |
| J16 Flash page swap          | The default position is a jumper installed on pins 2 and 3. Changing the position of this jumper will change which of the two pages of flash ROM is used when the system is started. You can use this jumper to recover from a BIOS flash update problem. To do this:  
1. Power-off the system.  
2. Move jumper J16; then, power-on the system. |
Memory Board Component Locations

The following simplified layout of the memory board identifies the components.

1. DIMM error LEDs
2. DIMM connectors
3. Processor board connector
Memory-Module Kits Installation

Adding memory to your server is an easy way to make programs run faster. You can increase the amount of memory in your server by installing options called memory-module kits. Each kit contains four industry-standard, dual inline memory modules (DIMMs). Your server uses 50 ns, 168-pin, error correction code (ECC), DIMMs. 60 ns DIMMs are not supported.
Notes

1. The memory module sizes available for your server are 32 MB, 64 MB, 128 MB, and 256 MB. At a minimum, your server requires four 32 MB DIMMs in bank 1.

2. The preinstalled memory board contains banks 1–4. The optional memory board contains banks 5–8. Install additional memory in bank 2; then, bank 3, and continue in numeric sequence. This is a guideline but it is not required to populate banks in this order.

3. All the DIMMs installed in a bank must be the same size and speed, but each bank can have different sized DIMMs installed.

4. Your server comes with one memory board and one terminator board preinstalled. The memory board contains four banks arranged in 16 DIMM connectors and supports 4-way memory interleaving.

You can replace the terminator board with an optional memory board containing an additional 16 DIMM connectors.

5. Installing or removing memory modules changes the configuration of the server. Therefore, after installing or removing a DIMM, save the new configuration information in the Configuration/Setup Utility program. When you restart the server, the system displays a message indicating that the memory configuration has changed. Start the Configuration/Setup Utility program and select **Save Settings**. See "Using the Configuration/Setup Utility Main Menu" on page 26 for more information.

6. Consider the memory expansion that is available with the DIMM size you are installing.

<table>
<thead>
<tr>

<td>4 GB</td>
<td>8 GB&lt;sup&gt;†&lt;/sup&gt;</td>
</tr>
</tbody>
</table>

<sup>†</sup> Requires greater than 32-bit operating system memory support, or device driver support.

Your server provides two features that increase memory access speed: address bit permuting (ABP) and card-to-card (C2C).
Notes

1. BIOS automatically enables ABP, C2C, or ABP and C2C together, depending on the memory configuration.
2. ABP can function without replacing the terminator board with an optional memory board. C2C provides better performance but requires DIMMs in both memory boards. C2C and ABP together provide the best performance.

</tbody>
</table>
To install a memory module:

1. Run the shutdown procedure for the operating system. Turn off the server and peripheral devices and disconnect all external cables and power cords (see “Preparing to Install Options” on page 160); then remove the front bezel (see “Removing the Front Bezel” on page 163), and the front access cover (see “Removing the Front Access Cover” on page 163).

2. Remove the memory board from the server:
   a. Pull the latches so they rotate to a 90-degree angle from the memory board.
   b. Grasp the two latches and carefully pull the memory board from the server.
   c. Place the memory board connector-side up on a flat, static-protective surface.

3. Touch the static-protective package containing the memory-module kit to any unpainted metal surface on the server. Then, remove the memory module from the package.

4. Install the memory module:

   **Attention:** To avoid breaking the retaining clips or damaging the memory-module connectors, handle the clips gently.

   a. Turn the memory module (DIMM) so that the pins align correctly with the connector.
b. Insert the DIMM into the connector by pressing on one edge of the DIMM and then on the other edge of the DIMM. Be sure to press straight into the connector.

c. Repeat the preceding step to make sure the DIMM is seated correctly.

d. Make sure the retaining clips are in the closed position.

e. If a gap exists between the DIMM and the retaining clips, the DIMM has not been properly installed. In this case, open the retaining clips and remove the DIMM; then, reinsert the DIMM.

f. Repeat these steps for each memory module that you install.

5. Reinstall the memory board:

a. Insert the memory board into the guides and gently press the memory board into the socket.

<table>
<thead>
<tr>
<th>Attention</th>
</tr>
</thead>
<tbody>
<tr>
<td>When you install the memory board in the server, be sure that it is completely and correctly seated in the connector before you apply force to close the latches. Incomplete insertion might cause damage to server components.</td>
</tr>
</tbody>
</table>

b. Push the latches until they close and lock in place.

6. If you have other options to install or remove, do so now; otherwise, go to “Completing the Installation” on page 97.
Microprocessor Kit Installation

Your server comes with one microprocessor installed on the processor board. When you install one or more additional microprocessor kits, your server can operate as a symmetric multiprocessing (SMP) server. With SMP, certain operating systems and application programs can distribute the processing load among the microprocessors. This enhances performance for database and point-of-sale applications, integrated manufacturing solutions, and other applications.

Before you begin:

- Read “Safety Information” on page 226.
- Thoroughly review the documentation that comes with the microprocessor, so that you can determine whether you need to update the server’s basic input/output system (BIOS). The latest level of BIOS for your server is available through the World Wide Web and the IBM Bulletin Board System (BBS). Refer to the “Help and Legal Information” section of this Server Library for the appropriate World Wide Web addresses and bulletin-board telephone numbers.

Notes

1. The illustrations in this section might differ slightly from your hardware.
2. To ensure proper server operation, when you install a new or additional microprocessor, use microprocessors with the same cache size as those of the currently installed microprocessor.
3. If you replace the microprocessor in your server with a microprocessor with a different speed, be sure to set the Microprocessor Core Frequency Selection jumper block correctly. (See “Processor Board Jumpers” on page 166 for more information.)
4. If you install additional microprocessors, be sure to set the Microprocessor Core Frequency Selection jumper block for the slowest speed microprocessor installed in your server. (See “Processor Board Jumpers” on page 166 for more information.)
5. To maintain signal quality and system reliability, either a microprocessor or the microprocessor terminator card must be installed in microprocessor socket 4. A microprocessor must be installed in microprocessor socket 1.
To install an additional microprocessor kit:

1. Run the shutdown procedure for the operating system. Turn off the server and peripheral devices and disconnect all external cables and power cords (see “Preparing to Install Options” on page 160); then remove the front bezel (see “Removing the Front Bezel” on page 163), and the front access cover (see “Removing the Front Access Cover” on page 163).

2. Remove the memory board from memory board socket 1:
   a. Pull the memory board latches so they rotate to a 90-degree angle from the memory board.
   b. Grasp the two latches and carefully pull the memory board from the server.
   c. Put the memory board aside on a flat, static-protective surface.

3. Remove the microprocessor retention bracket:
   a. Remove the shipping screw from the microprocessor retention bracket.
   b. Grasp the bracket handle and pull downwards firmly to detach the bracket from the server.
   c. Pivot the bracket to a 90-degree angle from the processor board.
d. Remove the bracket from the server.

4. Determine the microprocessor socket in which you want to install the new microprocessor.

**Note**

Your server comes with a microprocessor installed in socket 1. Install a second microprocessor in socket 2, a third microprocessor in socket 3, and a fourth microprocessor in socket 4.

5. If you are adding a fourth microprocessor, remove the microprocessor terminator card.

**Note**

To maintain signal quality and system reliability, a microprocessor or the microprocessor terminator card must be installed in microprocessor socket 4.

a. Pull the microprocessor terminator card latches so they rotate to a 90-degree angle from the microprocessor terminator card.
b. Grasp the two latches and carefully pull the microprocessor terminator card from the server.
c. Store the microprocessor terminator card in a safe place.

6. Install the two voltage regulator modules (VRM) included in the microprocessor kit.

a. Refer to the label in front of the processor board inside the server for the location of the VRM sockets.

**Note**

Install the VRMs for a second microprocessor in VRM sockets 2a and 2b. Install the VRMs for a third microprocessor in VRM sockets 3a and 3b. Install the VRMs for a fourth microprocessor in VRM sockets 4a and 4b.

b. Lift on the VRM retention bracket to detach the bracket from the chassis.
c. Carefully remove the bracket from the server.
d. Install the VRMs in the VRM sockets.
e. Install the VRM retention bracket.

**Note**

When correctly installed, the bracket holds the VRMs securely in place and does not move or shift.

7. Install the microprocessor:

a. Touch the static-protective package containing the new microprocessor to any unpainted metal
surface on the server; then, remove the microprocessor from the package.

b. Insert the microprocessor into the guides 7 and gently press the microprocessor into the socket. When correctly inserted, the microprocessor heat sink faces to the left.

Attn
Make sure the microprocessor is oriented and aligned correctly before you try to press it into the socket.

c. Push the latches 3 until they close and lock in place.

8. Install the microprocessor retention bracket:
   a. Insert the bottom edge of the bracket in the matching openings in the guide support.
   b. Rotate the bracket over the microprocessors.
   c. Grasp the bracket handle and press the bracket firmly into place. Insert both tabs on the bracket in the matching openings on the server chassis.

Note
When correctly installed, the bracket holds the microprocessors securely in place and does not move or shift.

9. Install the memory board:
   a. Insert the memory board into the guides and gently press the memory board into the socket.

Attn
When you install the memory board in the server, be sure that it is completely and correctly seated in the connector before you apply force to close the latches. Incomplete insertion might cause damage to server components.

b. Push the memory board latches 3 until they close and lock in place.

10. If you have other options to install or remove, do so now; otherwise, go to “Completing the Installation” on page 97.
Power Backplane Connector Locations

1. Processor Board Connector
2. SCSI Backplane Connector
3. Fan Connector (processor fans)
4. Fan Connector (DASD fans)
Power Backplane Removal

Before you begin:

Read “Safety Information” on page 226.

To remove the power backplane, do the following:

1. Remove the power supplies, see “Hot-Swap Power Supply Removal” on page 118.
2. Remove the AC power assembly, see “AC Power Assembly Removal” on page 87.
3. Remove the two power supply filler plate(s) screws and remove the filler plate(s).
4. Disconnect the power backplane cables.
5. Turn the 4 quarter-turn fasteners 1 and remove the power backplane assembly.
Power Control Card Removal

Before you begin:

Read “Safety Information” on page 226.

The power control card is located in the rear of the system.

To remove the power control card, do the following:

1. Power-off the system.
2. Disconnect all power to the system.
3. Remove the power control card screws 1.
4. Pull the power control card 2 out of the system.
Preparing to Install Options

Before you begin:

Read “Safety Information” on page 226 and “Working Inside a Server with Power On” on page 171.

Note

You do not need to turn the server off to install or replace hot-swap power supplies, hot-swap fans, hot-swap drives, or hot-plug PCI adapters.

If you are:

- Installing or removing a hot-plug PCI adapter, go to “Working with Adapters” on page 173.
- Installing or replacing a hot-swap hard disk drive, go to “Internal Drives Installation” on page 136.
- Installing a hot-swap power supply, go to “Hot-Swap Power Supply Installation” on page 115.
- Removing a hot-swap power supply, go to “Hot-Swap Power Supply Removal” on page 118.
- Replacing a hot-swap fan, go to “Hot-Swap Fan Assembly” on page 112.
- Installing or removing an option not listed in the preceding list, continue with the following steps.

1. Remove all media (diskettes, CDs, optical discs, or tapes) from the drives; then, turn off the server and all attached options.

Caution

The Power Control button on the front of the server does not turn off the electrical current supplied to the server. The server also might have more than one power cord. To remove all electrical current from the server, ensure that all power cords are disconnected from the power source.

2. If you have a modem or fax machine attached to the server, disconnect the telephone line from the wall outlet.

3. Unplug all power cords (cables) from electrical outlets.

4. Note the location of the remaining cables and cords; then disconnect them from the back of the server.
Caution

Electrical current from power, telephone, and communication cables can be hazardous. To avoid personal injury or equipment damage, disconnect the attached power cords, telecommunications systems, networks, and modems before you open the server covers, unless instructed otherwise in the installation and configuration procedures.

Removing the Top Cover: Refer to the following illustration while you perform the steps in this procedure.

Before you begin:
Read “Safety Information” on page 226.
To remove the server top cover:

1. Except if you are installing or removing a hot-swap option, run the shutdown procedure for the operating system, turn off the server and all attached devices, and disconnect all external cables and power cords (see “Preparing to Install Options” on page 160).
2. Loosen the two thumbscrews on the back edge of the top cover.
3. Slide the top cover slightly toward the rear of the server; the cover will stop after about 25 mm (1 inch). Lift the cover off the server and set the cover aside.
Removing the Front Bezel: Refer to the following illustration while you perform the steps in this procedure.

Before you begin:
Read “Safety Information” on page 226.

To remove the front bezel:
1. Press on the tabs at the top edge of the bezel 1.
2. Pivot the top of the bezel slightly away from the server and remove the bezel from the server.

Removing the Front Access Cover: Refer to the following illustration while you perform the steps in this procedure.

Before you begin:
Read “Safety Information” on page 226.
To remove the server front access cover:

1. Run the shutdown procedure for the operating system. Turn off the server and peripheral devices and disconnect all external cables and power cords (see “Preparing to Install Options” on page 160); then remove the front bezel (see “Removing the Front Bezel” on page 163).

2. Turn the two quarter-turn fasteners 1 on the top edge of the front access cover 2 to the unlocked position 3. Pivot the top of the front access cover away from the server and remove the cover from the server.

Attention: For correct cooling and airflow, install the front access cover before turning on the server. Operating the server with the front access cover removed might damage server components.
Processor Board Component Locations

A simplified layout of the processor board is shown in the following illustration.

Memory board slot 1 connector (primary slot)
Memory board slot 2 connector (secondary slot)
Microprocessor core frequency selection jumper block (J43–J46)
Processor board power-good LED
Microprocessor voltage-regulator connectors for microprocessor 4
Microprocessor voltage-regulator connectors for microprocessor 3
Left LED = ERR 1, Right LED = ERR 0
Microprocessor voltage-regulator connectors for microprocessor 2
Microprocessor voltage-regulator connectors for microprocessor 1
Microprocessor termination LED
Power-good test jumper J5 (default pins 1-2)
Microprocessor voltage-regulator LEDs
Microprocessor bus activity LED for microprocessor 4
Microprocessor bus activity LED for microprocessor 3
Microprocessor bus activity LED for microprocessor 2
Microprocessor bus activity LED for microprocessor 1
2.5 Volt power-good LED
Power backplane connector
Microprocessor 1 socket
Microprocessor 2 socket
Microprocessor 3 socket
Microprocessor 4 socket
I/O board connector
### Processor Board Jumpers

Table 13 describes the jumpers on the processor board. The highlighted numbers in the table correspond to the highlighted numbers on the illustration in “Processor Board Component Locations” on page 165.

#### Notes

1. Turn off the server, and disconnect the power cord before moving any jumpers.
2. Be sure the microprocessor bus-to-core ratio is set correctly. For example, if you have a 450 MHz microprocessor installed and the system bus speed is 100 MHz (the default), be sure that the jumpers are set to a bus-to-core ratio of 4.5 (450/100). Refer to jumpers J43–J46 in Table 13.
3. Be sure to set the Microprocessor Core Frequency Selection jumper block for the slowest speed microprocessor installed in your server. For example, if your server has a 400 MHz microprocessor installed and you install three 450 MHz microprocessors, set the Microprocessor Core Frequency Selection jumper block for the 400 MHz microprocessor.

MHz denotes internal clock speed of the microprocessor only; other factors also affect application performance.

#### Attention

If the microprocessor bus-to-core ratio is incorrect, board components will overheat and component damage might occur. Be sure that the microprocessor bus-to-core ratio jumper is properly set.

#### Table 13. Processor Board Jumpers

<table>
<thead>
<tr>
<th>Jumper Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Microprocessor core frequency selection (J43–J46)</td>
<td>The default core/bus fraction is 4.0 (400/100 MHz). Jumpers are installed on pins 1 and 2 of J44, J45 and J46, and jumpers are installed on pins 2 and 3 of J43. For the core/bus fraction 4.5 (450/100 MHz), the jumpers are installed on pins 1 and 2 of J44, and jumper are installed on pins 2 and 3 of J43 and J45. For the core/bus fraction 5.0 (500/100 MHz), the jumpers are installed on pins 2 and 3 of J43 and J44, and jumper are installed on pins 1 and 2 of J45 and J46. For the core/bus fraction 5.5 (550/100 MHz), the jumpers are installed on pins 2 and 3 of J43, J44, and J45, and jumpers are installed on pins 1 and 2 of J46.</td>
</tr>
</tbody>
</table>

166 Netfinity Server HMM
Processor Board Assembly Removal

Before you begin:

Read “Safety Information” on page 226.

To Remove the processor board, do the following:
1. Power-off the system.
2. Disconnect all power to the system.
3. Remove the top cover, see “Removing the Top Cover” on page 161.
4. Remove the front bezel, see “Removing the Front Bezel” on page 163.
5. Remove the following items, see “Microprocessor Kit Installation” on page 153.
   a. Processor Retention Bracket 1
   b. Processor(s) 2
   c. Processor Terminator Card 3
   d. Memory Card 4
   e. Memory Terminator Card 5
   f. VRM Retention Bracket 6
6. Disconnect the processor board cables.
7. Remove the shuttle assembly, see “Shuttle Assembly Removal” on page 169.
8. Turn the three quarter-turn fasteners 7 and remove the processor board assembly.
Quarter-Turn Fastener
The following drawing shows the quarter-turn fastener lock and unlock positions.

SCSI Backplane Component Locations
The following simplified layout of the SCSI backplane identifies the components. Refer to this figure when you set the jumpers on the backplane.

1. Wide (16-bit) SCSI connector
2. SCSI hot-swap drive connectors (on opposite side of backplane)
3. SAF-TE SCSI Card connector
4. Power connector
Shuttle Assembly Removal

Before you begin:

Read “Safety Information” on page 226.

To Remove the shuttle assembly, do the following:

1. Power-off the system.
2. Disconnect all power to the system.
3. Remove the top cover, see “Removing the Top Cover” on page 161.
4. Disconnect all I/O board cables.
5. Disconnect all cables attached to the adapters installed on the I/O board.
6. Remove all adapters installed on the I/O board.
7. Remove the shuttle retainer clip 1.
8. Remove the shuttle plate latch screw 2 and rotate the shuttle plate latch away from the system. This will release the shuttle from the system.
9. While lifting up on the front of the shuttle 3, slide the shuttle out of the system.
Working Inside a Server with Power On

Your server is designed to operate safely while powered on with the top cover removed. The server is designed to protect you and the server. Here are some simple guidelines to follow when you work inside your server while the server is powered on:

- Avoid loose-fitting clothing on your forearms. (Button the cuffs on long-sleeved shirts before working inside the server; do not wear cufflinks while you are working inside the server.)
- Do not allow your necktie or scarf to hang inside the server.
- Remove jewelry, such as bracelets and loose-fitting wrist watches.
- Remove items from your shirt pocket (such as pens and pencils) that could fall into the server as you lean over it.
- Take care to avoid dropping any metallic objects, such as paper clips, hair pins, or screws, into the server.

The Netfinity 7000 M10 incorporates new design features and components.

I/O Board and I/O Function Card: The server replaces the system board with an I/O board and an I/O function card. Together, the I/O board and the I/O function card provide the functionality of a system board. This modular design improves serviceability and provides for a compact design.

Netfinity Advanced Remote Management Controller: With a Netfinity Advanced Remote Management Controller, in conjunction with Netfinity Manager, you can locally and remotely configure and monitor many features of your server.

**Note**
You must have the Advanced Remote Management Controller installed for proper operation of your server and to use the system-management functions the adapter provides.

For more information:
- See “What the IBM Netfinity 7000 M10 Offers” on page 42 for an overview of the functions and features
- See “Connecting External Options” on page 100 for a detailed description of the connectors
- See “Advanced System Management PCI Adapter Component Locations” on page 88 for a layout showing the component locations
- Refer to the “Advanced Remote Management Reference” section of this *Server Library* for installation, startup, and operating instructions
Working with Adapters

You can add adapters to extend the capabilities and power of your server. Many adapters provide bus-master capabilities, which enable the adapters to perform operations without interrupting the server's microprocessors. You add adapters to the expansion connectors, called slots, on the I/O board of your server. All slots are peripheral component interconnect (PCI) expansion slots. Your server supports up to 12 adapters in the PCI slots.

You can install a new PCI adapter or replace an existing PCI adapter with the same type of adapter without turning the server power off and restarting the system. These slots are called hot-pluggable PCI slots. They are also referred to as hot-plug PCI slots. Hot-plug requires support from both the operating system and the adapter device driver.

A PCI adapter comes with built-in identification and configuration specifications (set in memory on the device) that provide installation information to the server during startup. This information is read by the input/output (I/O) bus and interpreted by the server BIOS. The BIOS routines automatically configure the adapter around the resources already in use by other devices.

Your server comes with a video controller. This video controller is an integrated component on the I/O function card. The integrated video controller has super video graphics array (SVGA) technology.

The integrated video controller is not removable. If you want to disable this controller and use a video adapter instead, you can install a video adapter in an expansion slot. When you install a PCI video adapter, the server BIOS automatically disables the integrated video controller.

The integrated video controller has 1 MB of video memory. The integrated video controller supports the following screen resolutions:

- $640 \times 480$ pels with up to 65,536 colors
- $800 \times 600$ pels with up to 65,536 colors
- $1024 \times 768$ pels with up to 256 colors
- $1152 \times 864$ pels with up to 256 colors

The following illustration shows the location of the expansion slots and other components referred to in these steps.
LEDs for PCI Slots: Each PCI slot has three lights associated with it — two Attention lights and one Power On light.

- **Power On Light:** This light is on when the PCI slot is active and has power. Do not add or remove an adapter from the PCI slot when the Power On light is on. When this light is off, the PCI slot is inactive and has no power applied. You can install or remove an adapter when the Power On light is off. Refer to your operating system documentation to determine if it supports hot-plug PCI adapters.

- **Attention Lights:** Each PCI slot has two Attention lights: one that is visible from the rear of the server and one that is visible inside the server. (The lights have the same meaning; they are duplicated to be visible from outside or inside the server.) An Attention light flashes approximately once per second when it is on. The meaning of the Attention lights is defined by your operating system. Refer to your operating system documentation to determine if it supports hot-plug PCI adapters and, if so, what the Attention lights indicate.
Adapter Considerations: Before you continue with the adapter-installation procedure:

- Review and follow the instructions that come with the adapter and your operating system in addition to the instructions given in this chapter. If you need to change the switch or jumper settings on your adapter, follow the instructions that come with the adapter documentation.
- You can install full-length PCI adapters in all PCI expansion slots.
- Your server supports only 5.0 V DC PCI adapters.
- Your server uses a rotational interrupt technique to configure PCI adapters. This technique enables you to install a variety of PCI adapters that currently do not support sharing of PCI interrupts.
- For a list of compatible RAID adapters, and installation requirements, refer to http://www.pc.ibm.com/us/compat/ on the World Wide Web. If you install a RAID adapter, configure the adapter using the RAID adapter documentation.
- The I/O function card slot can support only the I/O function card. It is not an expansion slot.
- The system-management adapter slot can only support the Advanced Remote Management Controller. It is not an expansion slot.
- Your server has three 33 MHz PCI buses.
  - PCI slots 11 and 12 are on PCI bus C (bus numbers 0 and 1, with bus numbers 2 and 3 reserved for adapters that require bus number assignments).
  - PCI slots 6–10 are on PCI bus B (bus number 4, with bus number 5–9 reserved for adapters that require bus number assignments).
  - PCI slots 1–5 are on PCI bus A (bus number 10, with bus numbers 11–15 reserved for adapters that require bus number assignments).
- You can install 32-bit adapters in 64-bit slots and 64-bit adapters in 32-bit slots.
- Spread the installation of high speed adapters, such as Gb Ethernet adapters, between the three PCI buses to optimize performance.

Configuring Adapters: PCI devices automatically communicate with the server configuration information. This usually results in automatic configuration of a PCI device. From the Configuration/Setup Utility program, you can select available resources for the adapter that you are installing. If a conflict does occur, see “Resolving Configuration Conflicts” on page 36.

Refer to the documentation that comes with the adapter for information about required system resources. Then, make the appropriate jumper or switch settings on the adapter.
Installing a Hot-Plug PCI Adapter: This section gives the procedure for installing a hot-plug PCI adapter. If you want to remove a hot-plug adapter, reverse the steps. If your operating system supports hot-replace PCI adapters, you can replace a failing hot-plug PCI adapter with a new adapter of the same type without turning off power to the server. If your operating system and adapter also support the hot-add feature, you can install a new adapter without turning off the power to the server.

**Note**
You do not need to turn the server off to install or remove a hot-plug PCI adapter.

**Before you begin:**
- Read “Safety Information” on page 226 and “Working Inside a Server with Power On” on page 171.
- Read the documentation that comes with your adapter for any special requirements or restrictions.
- Read the documentation that comes with your operating system.

**Attention**
Do not remove a hot-plug adapter before performing the operating-system-defined procedure for disabling the hot-plug PCI slot that contains the adapter. Failure to do so might cause your system to lock up. Refer to your operating system documentation.
Refer to the following illustrations while you perform the steps in this procedure.

1. Tab
2. Adapter retention latch
3. Expansion slot cover
4. Attention light
5. Power light
6. Plastic divider
To install a hot-plug PCI adapter:

1. Remove the top cover (see “Removing the Top Cover” on page 161).
2. Determine which expansion slot you will use for the adapter.
   
   **Note**
   Check the instructions that come with the adapter for any requirements or restrictions.

3. Disable the PCI slot from your operating system. (Refer to the documentation that comes with your operating system for information about disabling a hot-plug PCI slot.)

   **Attention:** Make sure the Power On light for the expansion slot is off before you continue with the next step. Failure to do so might cause your system to lock up.
4. Remove the expansion-slot cover:
   a. Rotate the adapter retention latch.
   b. Lift the tab covering the top of the expansion-slot cover and remove the expansion-slot cover from the server. Store it in a safe place for future use.

   **Attention:** Expansion-slot covers must be installed on all vacant slots. This maintains the electromagnetic-emissions characteristics of the system and ensures proper cooling of system components.

5. Refer to the documentation that comes with your adapter for any cabling instructions. It might be easier for you to route any cables before you install the adapter.

6. Remove the adapter from the static-protective package.

   **Note**
   Avoid touching the components and gold-edge connectors on the adapter.

7. Place the adapter, component-side up, on a flat, static-protective surface.

8. Set any jumpers or switches as described by the adapter manufacturer.

9. Install the adapter:
   a. Carefully grasp the adapter by its top edge or upper corners, and align it with the expansion slot on the I/O board.
   b. Press the adapter firmly into the expansion slot.

   **Attention:** When you install an adapter in the server, be sure that it is completely and correctly seated in the connector. Incomplete insertion might cause damage to server components or the adapter.
   c. Lower the tab over the adapter. Rotate the adapter retention latch until it snaps in place.

   **Note**
   The expansion slot also has an adapter retention latch at the opposite end of the slot. To remove the adapter, push the adapter retention latch away from the adapter until the top edge of the adapter is past the latch.

10. Connect any cables to the adapter.
11. Enable the PCI slot from your operating system.
    Make sure the Power On light for the PCI slot is on.
12. If you have other options to install or remove, do so now; otherwise, go to “Completing the Installation” on page 97.
Installing a Non-Hot-Plug PCI Adapter: This section gives the procedures for installing a non-hot-plug adapter. If you want to remove a non-hot-plug adapter, reverse the steps.

### Before you begin:
- Read “Safety Information” on page 226.
- Read the documentation that comes with your adapter for any special requirements or restrictions.

Refer to the illustrations in “Installing a Hot-Plug PCI Adapter” on page 176 while you perform the steps in this procedure.

### To install a non-hot-plug PCI adapter:
1. Run the shutdown procedure for the operating system. Turn off the server and peripheral devices and disconnect all external cables and power cords (see “Preparing to Install Options” on page 160); then remove the top cover (see “Removing the Top Cover” on page 161).
2. Determine which expansion slot you will use for the adapter.

   **Note**

   Check the instructions that come with the adapter for any requirements or restrictions.

3. Remove the expansion-slot cover:
   a. See the illustrations in “Installing a Hot-Plug PCI Adapter” on page 176 for operation of the adapter retention latch on the end of the slot near the rear of the server.
   b. Rotate the adapter retention latch.
   c. Lift the tab covering the top of the expansion-slot cover and remove the expansion-slot cover from the server. Store it in a safe place for future use.

   **Attention:** Expansion-slot covers must be installed on all vacant slots. This maintains the electromagnetic-emissions characteristics of the system and ensures proper cooling of system components.

4. Refer to the documentation that comes with your adapter for any cabling instructions. It might be easier for you to route any cables before you install the adapter.
5. Remove the adapter from the static-protective package.
6. Place the adapter, component-side up, on a flat, static-protective surface.

7. Set any jumpers or switches as described by the adapter manufacturer.

8. Install the adapter:
   a. Carefully grasp the adapter by its top edge or upper corners, and align it with the expansion slot on the I/O board.
   b. Press the adapter firmly into the expansion slot.
   c. Refer to the illustration in "Installing a Hot-Plug PCI Adapter" on page 176 for operation of the adapter retention latch on the end of the slot near the rear of the server.
   d. Lower the tab over the adapter. Rotate the adapter retention latch until it snaps in place.
   e. Connect any cables to the adapter.

9. If you have other options to install or remove, do so now; otherwise, go to “Completing the Installation” on page 97.

Verifying Compatibility between Network Adapters and Device Drivers: Your server supports several types of network adapters. If you are having trouble with the installation or operation of a network adapter or network operating system, ensure that the network-adapter device driver supports multiple processors. Refer to your network-adapter documentation for additional information about adapter compatibility requirements.
Symptom-to-FRU Index

This index supports Netfinity 7000-M10 - Type 8680 servers.

Notes
1. Check the configuration before you replace a FRU. Configuration problems can cause false errors and symptoms.
2. For IBM devices not supported by index, refer to the manual for that device.
3. Always start with “General Checkout” on page 6.

The Symptom-to-FRU Index lists symptoms, errors, and the possible causes. The most likely cause is listed first. Use this Symptom-to-FRU Index to help you decide which FRUs to have available when servicing the computer.

Beep Symptoms

Beep symptoms are short tones or a series of short tones separated by pauses (intervals without sound). See the following examples.

Note
One beeps after successfully completing POST indicated the system is functioning properly.

<table>
<thead>
<tr>
<th>Beeps</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-2-3</td>
<td>One beep&lt;br&gt;A pause (or break)&lt;br&gt;Two beeps&lt;br&gt;A pause (or break)&lt;br&gt;Three beeps</td>
</tr>

## Error Symptoms

<table>
<thead>
<tr>
<th>Error Symptom</th>
<th>FRU/Action</th>
</tr>
</thead>
</table>
| CD is not working properly.                                                   | 1. Clean the CD  
2. Clean the optical-head lens.  
3. CD-ROM Drive                                                               |
| CD-ROM drive tray is not working.                                            | 1. Insert the end of a paper clip into the manual tray-release opening.  
2. CD-ROM Drive                                                               |
| CD-ROM drive is not recognized.                                              | 1. Run Configuration/Setup, enabled primary IDE channel.  
2. Check cables and jumpers.  
3. Check for correct device driver.                                          |
| Diskette drive in-use light stays on, or the system bypasses the diskette drive. | If there is a diskette in the drive, verify that:  
1. The diskette drive is enabled in the configuration programs.  
2. The diskette is good and not damaged. (Try another diskette if you have one.)  
3. The diskette is inserted correctly in the drive.  
4. The diskette contains the necessary files to start the server.  
5. The software program is OK.  
If the diskette drive in-use light stays on, or the system continues to bypass the diskette drive, replace the diskette drive. |
| Fan (one only) not running.                                                   | 1. Swap fans to see if the fan is defective.  
2. Power Control Card  
3. Fan Cable                                                                 |
| Fans (two only) not running.                                                  | 1. Check the connection between the fan cables and the power backplane.  
2. Fans  
3. Power Control Card  
4. Power Backplane                                                              |
| Fans (all) not running.                                                       | 1. Check fan cables  
2. Power Control Card  
3. Power Backplane                                                              |

Power Control Card LED

The power control card LED is located on the rear of the system. If the power control card LED is not flashing, replace the power control card.

Power Supply LED Errors.

Use the power supply LED information on the following page to troubleshoot power supply problems.

---

**Note**

The minimum configuration required for the DC Good light to come on is:

- I/O Board
- Power AC Inlet Box
- Power Backplane
- Power Control Card
- Power Supply
- Processor Board

---

**Important**

If you cannot power the system off with the front panel switch:

1. If ACPI is enabled in Setup, you must hold the power button for 5 seconds.
2. Disconnect the AC power.
3. Remove the battery.
5. Power-off the server.
6. Replace the battery.

---

**Table 14 (Page 1 of 2): Power Supply LED Errors**

</thead>
</table>
| On          | Off         | Standby mode or DC problem. | 1. Verify power supply switch is on.  
2. The LED on the power control card should be flashing; if not, replace the power control card.  
3. Check the power backplane to processor board cable connections.  
4. Disconnect the power cord; then, disconnect or remove all adapters, cables and power connectors to all internal and external devices, memory cards, processors, processors terminator cards, and VRMs.  
5. Install a jumper on J7 of the I/O board, see “I/O Board Component Locations” on page 142.  
6. Connect the power cord; then, check the DC Good light on the power supply. If the DC Good light on the power supply is on, remove the jumper you installed on J7; then, replace the components in the following order to isolate the failing component.  
   a. I/O Function Card  
   b. All remaining components, one at a time.  
If the DC Good light on the power supply is still off, replace the following components in the order listed until the light comes on.  
   a. Processor Board  
   b. I/O Board  
   c. Power Backplane  
   d. VDF Card  
   e. Power Supply |
| On          | On          | Power is OK | None |

SCSI LEDs
Check the status LED. If on, do the following:
1. Check the internal SCSI cable.
2. Replace the failing hard disk drive.
3. Replace the SCSI backplane.
4. Replace the hard disk drive controller (PCI adapter or I/O Function card).

</tr>
<tr>
<td></td>
<td>5. The SCSI devices are configured correctly.</td>
</tr>
</tbody>
</table>

One or more of the following might be causing the problem:
- A failing SCSI device (adapter, hard drive, controller)
- An improper SCSI configuration or SCSI termination jumper setting
- Duplicate SCSI IDs in the same SCSI chain
- A missing or improperly installed SCSI terminator
- A defective SCSI terminator
- An improperly installed cable
- A defective cable

External SCSI devices must be powered-on before you power-on the server.
### SMBUS Error (3-3-2)

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>The minimum system configuration required to force power-on the system using I/O board jumper J7 is:</td>
</tr>
<tr>
<td>• One bank of memory on one memory card with terminator</td>
</tr>
<tr>
<td>• One processor with two VRMs and terminator card</td>
</tr>
<tr>
<td>• One power supply</td>
</tr>
</tbody>
</table>

If the system displays a 3-3-2 error and powering off, waiting for 20 seconds; then, powering on the system does not correct the problem, do the following:

1. Connect remotely to the system and check the system error log.
2. Remove the system management card.
3. Disconnect the front panel cable form the I/O function card.
4. Disconnect the SCSI power cable.
5. Remove/disable all adapters.
6. Use jumper J7 on the I/O board to power-on the server.
7. If the server starts, attach/install the components one at a time in the following order, until you isolate the failing FRU.
   a. Front Panel to I/O Card Cable
   b. System Management Card
   c. SCSI Power Cable
   d. Adapter cards, one at a time.
8. If the server does not start with the minimum required configuration, replace the following FRUs in the order listed.
   a. Power Control Card
   b. Processor Board
   c. I/O Board
   d. Power Backplane
   e. I/O Function Card
Undetermined Problems

You are here because the diagnostic tests did not identify the failure, the Devices List is incorrect, or the system is inoperative.

Notes

1. If you suspect a software mismatch is causing failures (solid or intermittent), be sure to see “Resolving Configuration Conflicts” on page 36.
2. A corrupt CMOS can cause undetermined problems.

Check the LEDs on all the power supplies, see “Power Supply LED Errors.” on page 194. If the LEDs indicate the power supplies are working correctly, do the following:

1. If a component has been added, reseat the added component and components around it, and retest.
2. If the system has been moved recently, reseat all the components and retest.
3. Check the LEDs on the processor board, see “Processor Board Component Locations” on page 165.
   a. Check the 2.5V LED; if not on, replace processor board.
   b. Check the VRM error LEDs. There are two VRMs per processor. For the VRM LED to be off, a good processor and two good VRMs (A and B) must be installed. If a LED is on:
      1) Replace VRM A and VRM B.
      2) Replace the processor.
   c. Check Termination LED. If not on:
      1) Ensure a processor card is in slot 1 and a processor or terminator is in slot 4.
      2) Reseat Processor/terminator in slot 4.
      3) Replace Processor/terminator in slot 4.
   d. Check Power Good LED (Verify jumper J5 is on pins 1 & 2, default positions). If not on:
      1) Replace Processor Board.
      2) Replace I/O Board.
   e. Check ERR0 and ERR1 LEDs.
      1) If ERR0 on and ERR1 off, F16 bus error:
         a) Replace I/O Board.
      2) If ERR0 off and ERR1 on, memory bus error, strip to single bank, and retest. If still on:
         a) Replace single bank of DIMMs.
         b) Replace Memory Board.
         c) Replace Processor Board.
      3) If ERR0 on and ERR1 on, processor bus error, strip to single processor in slot 1 and processor/terminator to slot 4. If still on:
a) Replace terminator.
b) Replace processor.
c) Replace processor board.

4. Check the I/O board LEDs, see “I/O Board Component Locations” on page 142.
   a. Check I/O Board Power Supply Power Good LED. If not on, replace power control card.
   b. Check Reset LEDs. If on:
      1) Replace I/O Function Card.
      2) Replace I/O Backplane
   c. Check PCI slot power LEDs. If adapter is present but power LED is not on:
      1) Ensure hot plug switch is closed.
      2) Replace adapter.
      3) Replace PCI sensor card.
      4) Replace I/O board.
   d. Check PCI bus SERR/PERR LEDs. If on, (error on PCI A, B, or C bus), replace or remove adapters in the appropriate PCI slots.
   e. Check Secondary PCI SERR/PERR LEDs. If on, (error on secondary bus):
      1) Replace I/O Function card.
      2) Replace system management card.
   f. Check NMI LED. If on:
      1) Replace I/O Board.
      2) Replace processor.
      3) Replace processor board.

5. Check Memory Card error LEDs. If any error LED is on:
   a. Replace the DIMM for that LED.
   b. Replace the memory card for that LED.

6. Power-off the computer.

7. Be sure the system is cabled correctly.

8. Remove or disconnect the following (one at a time) until you find the failure (power-on the computer and reconfigure each time):
   - Any external devices
   - Surge suppressor device (on the computer)
   - Modem, printer, mouse, or non-IBM devices
   - Each adapter
   - Drives
   - Memory-Module Kits (Minimum requirement = 1 bank of 32 MB DIMMs)
Note

Minimum operating requirements are:

- I/O Board
- I/O Function Card
- Power AC Inlet Box
- Power Backplane
- Power Control Card
- Power Supply
- Processor Board
- Processor and 2 VRMs
- Processor Terminator Card
- Memory Card
- Memory-Module Kits (Minimum requirement = 1 bank of 32 MB DIMMs)
- Memory Terminator Card
- Video Monitor (Display)

9. Put a jumper on I/O board jumper J7; then, power-on the computer. If the problem remains, suspect the following FRUs in the order listed:
   - Power Supply
   - Power Control Card
   - Power Backplane
   - I/O Board
   - Processor Board

Note

If the problem goes away when you remove an adapter from the system, and replacing that adapter does not correct the problem, suspect the I/O board then the processor board(s)
System Management Codes
The following page contains the system management codes. These codes are displayed on the front panel.

Notes
1. See “System Error Log” on page 34 for instruction for viewing the error log. Check for additional information on all system managements codes.
2. To reset the system management card, shutdown the system and remove the power for 10 seconds.
1. See the system error log and follow the instruction for the error in the log.
2. See system error log for other possible errors.

### Table 15 (Page 1 of 4): System Management Codes

Safety Information

The following section contains the safety information that you need to be familiar with before servicing an IBM mobile computer.

General Safety

Follow these rules to ensure general safety:

- Observe good housekeeping in the area of the machines during and after maintenance.
- When lifting any heavy object:
  1. Ensure you can stand safely without slipping.
  2. Distribute the weight of the object equally between your feet.
  3. Use a slow lifting force. Never move suddenly or twist when you attempt to lift.
  4. Lift by standing or by pushing up with your leg muscles; this action removes the strain from the muscles in your back. Do not attempt to lift any objects that weigh more than 16 kg (35 lb) or objects that you think are too heavy for you.
- Do not perform any action that causes hazards to the customer, or that makes the equipment unsafe.
- Before you start the machine, ensure that other service representatives and the customer's personnel are not in a hazardous position.
- Place removed covers and other parts in a safe place, away from all personnel, while you are servicing the machine.
- Keep your tool case away from walk areas so that other people will not trip over it.
- Do not wear loose clothing that can be trapped in the moving parts of a machine. Ensure that your sleeves are fastened or rolled up above your elbows. If your hair is long, fasten it.
- Insert the ends of your necktie or scarf inside clothing or fasten it with a nonconductive clip, approximately 8 centimeters (3 inches) from the end.
- Do not wear jewelry, chains, metal-frame eyeglasses, or metal fasteners for your clothing.
  
  **Remember:** Metal objects are good electrical conductors.
- Wear safety glasses when you are: hammering, drilling soldering, cutting wire, attaching springs, using solvents, or working in any other conditions that might be hazardous to your eyes.
- After service, reinstall all safety shields, guards, labels, and ground wires. Replace any safety device that is worn or defective.
- Reinstall all covers correctly before returning the machine to the customer.
Electrical Safety

Caution

Electrical current from power, telephone, and communication cables can be hazardous. To avoid personal injury or equipment damage, disconnect the attached power cords, telecommunication systems, networks, and modems before you open the server covers, unless instructed otherwise in the installation and configuration procedures.

Observe the following rules when working on electrical equipment.

Important

Use only approved tools and test equipment. Some hand tools have handles covered with a soft material that does not insulate you when working with live electrical currents.

Many customers have, near their equipment, rubber floor mats that contain small conductive fibers to decrease electrostatic discharges. Do not use this type of mat to protect yourself from electrical shock.

- Find the room emergency power-off (EPO) switch, disconnecting switch, or electrical outlet. If an electrical accident occurs, you can then operate the switch or unplug the power cord quickly.
- Do not work alone under hazardous conditions or near equipment that has hazardous voltages.
- Disconnect all power before:
  - Performing a mechanical inspection
  - Working near power supplies
  - Removing or installing main units
- Before you start to work on the machine, unplug the power cord. If you cannot unplug it, ask the customer to power-off the wall box that supplies power to the machine and to lock the wall box in the off position.
- If you need to work on a machine that has exposed electrical circuits, observe the following precautions:
  - Ensure that another person, familiar with the power-off controls, is near you.

 Remember: Another person must be there to switch off the power, if necessary.
  - Use only one hand when working with powered-on electrical equipment; keep the other hand in your pocket or behind your back.
Remember: There must be a complete circuit to cause electrical shock. By observing the above rule, you may prevent a current from passing through your body.

- When using testers, set the controls correctly and use the approved probe leads and accessories for that tester.
- Stand on suitable rubber mats (obtained locally, if necessary) to insulate you from grounds such as metal floor strips and machine frames.

Observe the special safety precautions when you work with very high voltages; these instructions are in the safety sections of maintenance information. Use extreme care when measuring high voltages.

- Regularly inspect and maintain your electrical hand tools for safe operational condition.
- Do not use worn or broken tools and testers.
- Never assume that power has been disconnected from a circuit. First, check that it has been powered-off.
- Always look carefully for possible hazards in your work area. Examples of these hazards are moist floors, nongrounded power extension cables, power surges, and missing safety grounds.
- Do not touch live electrical circuits with the reflective surface of a plastic dental mirror. The surface is conductive; such touching can cause personal injury and machine damage.
- Do not service the following parts with the power on when they are removed from their normal operating places in a machine:
  - Power supply units
  - Pumps
  - Blowers and fans
  - Motor generators
and similar units. (This practice ensures correct grounding of the units.)

- If an electrical accident occurs:
  - Use caution; do not become a victim yourself.
  - Switch off power.
  - Send another person to get medical aid.

Safety Inspection Guide
The intent of this inspection guide is to assist you in identifying potentially unsafe conditions on these products. Each machine, as it was designed and built, had required safety items installed to protect users and service personnel from injury. This guide addresses only those items. However, good judgment should be used to identify potential safety hazards due to attachment of non-IBM features or options not covered by this inspection guide.
If any unsafe conditions are present, you must determine how serious the apparent hazard could be and whether you can continue without first correcting the problem.

Consider these conditions and the safety hazards they present:

- Electrical hazards, especially primary power (primary voltage on the frame can cause serious or fatal electrical shock).
- Explosive hazards, such as a damaged CRT face or bulging capacitor
- Mechanical hazards, such as loose or missing hardware

The guide consists of a series of steps presented in a checklist. Begin the checks with the power off, and the power cord disconnected.

Checklist:

1. Check exterior covers for damage (loose, broken, or sharp edges).
2. Power-off the computer. Disconnect the power cord.
3. Check the power cord for:
   a. A third-wire ground connector in good condition. Use a meter to measure third-wire ground continuity for 0.1 ohm or less between the external ground pin and frame ground.
   b. The power cord should be the appropriate type as specified in the parts listings.
   c. Insulation must not be frayed or worn.
4. Remove the cover.
5. Check for any obvious non-IBM alterations. Use good judgment as to the safety of any non-IBM alterations.
6. Check inside the unit for any obvious unsafe conditions, such as metal filings, contamination, water or other liquids, or signs of fire or smoke damage.
7. Check for worn, frayed, or pinched cables.
8. Check that the power-supply cover fasteners (screws or rivets) have not been removed or tampered with.
Handling Electrostatic Discharge-Sensitive Devices

Any computer part containing transistors or integrated circuits (ICs) should be considered sensitive to electrostatic discharge (ESD). ESD damage can occur when there is a difference in charge between objects. Protect against ESD damage by equalizing the charge so that the machine, the part, the work mat, and the person handling the part are all at the same charge.

Notes:

1. Use product-specific ESD procedures when they exceed the requirements noted here.
2. Make sure that the ESD protective devices you use have been certified (ISO 9000) as fully effective.

When handling ESD-sensitive parts:

- Keep the parts in protective packages until they are inserted into the product.
- Avoid contact with other people.
- Wear a grounded wrist strap against your skin to eliminate static on your body.
- Prevent the part from touching your clothing. Most clothing is insulative and retains a charge even when you are wearing a wrist strap.
- Use the black side of a grounded work mat to provide a static-free work surface. The mat is especially useful when handling ESD-sensitive devices.
- Select a grounding system, such as those listed below, to provide protection that meets the specific service requirement.

Note: The use of a grounding system is desirable but not required to protect against ESD damage.

- Attach the ESD ground clip to any frame ground, ground braid, or green-wire ground.
- Use an ESD common ground or reference point when working on a double-insulated or battery-operated system. You can use coax or connector-outside shells on these systems.
- Use the round ground-prong of the AC plug on AC-operated computers.

Grounding Requirements

Electrical grounding of the computer is required for operator safety and correct system function. Proper grounding of the electrical outlet can be verified by a certified electrician.
Laser compliance statement

Some IBM Personal Computer models are equipped from the factory with a CD-ROM drive. CD-ROM drives are also sold separately as options. The CD-ROM drive is a laser product. The CD-ROM drive is certified in the U.S. to conform to the requirements of the Department of Health and Human Services 21 Code of Federal Regulations (DHHS 21 CFR) Subchapter J for Class 1 laser products. Elsewhere, the drive is certified to conform to the requirements of the International Electrotechnical Commission (IEC) 825 and CENELEC EN 60 825 for Class 1 laser products.

When a CD-ROM drive is installed, note the following.

CAUTION:

Use of controls or adjustments or performance of procedures other than those specified herein might result in hazardous radiation exposure.

O uso de controles, ajustes ou desempenho de procedimentos diferentes daqueles aqui especificados pode resultar em perigosa exposição à radiação.

凡未在这里指明的任何控制用法、调整、行为，
都会导致严重后果。

Pour éviter tout risque d’exposition au rayon laser, respectez les consignes de réglage et d’utilisation des commandes, ainsi que les procédures décrites.

Werden Steuer- und Einstellelemente anders als hier festgesetzt verwendet, kann gefährliche Laserstrahlung auftreten.

Az itt előírt eljárásoktól, beállításoktól és vezérlésektől eltérő a lézersugárzás veszélye miatt kockázatos!

L’utilizzo di controlli, regolazioni o l’esecuzione di procedure diverse da quelle specificate possono provocare l’esposizione a

Использование элементов настройки и выполнение процедур иных, чем указано здесь, может привести к опасному радиационному облучению.
El uso de controles o ajustes o la ejecución de procedimientos distintos de los aquí especificados puede provocar la exposición a radiaciones peligrosas.

Opening the CD-ROM drive could result in exposure to hazardous laser radiation. There are no serviceable parts inside the CD-ROM drive. **Do not open.**

Some CD-ROM drives contain an embedded Class 3A or Class 3B laser diode. Note the following.

**DANGER:**

Laser radiation when open. **Do not stare into the beam, do not view directly with optical instruments, and avoid direct exposure to the beam.**

Radiação por raio laser ao abrir. **Não olhe fixo no feixe de luz, não olhe diretamente por meio de instrumentos óticos e evite exposição direta com o feixe de luz.**

开启时会有激光发射时，请勿直视激光光束，**请勿直接查看视觉仪器，并且避免直接接触在激光光束之中。**

Rayonnement laser si carter ouvert. **Évitez de fixer le faisceau, de le regarder directement avec des instruments optiques, ou de vous exposer au rayon.**

Laserstrahlung bei geöffnetem Gerät. **Nicht direkt oder über optische Instrumente in den Laserstrahl sehen und den Strahlungsbereich meiden.**

Kinyításkor lézersugár! **Ne nézzen bele se szabad szemmel, se optikai eszközökkel. Kerülje a sugárnyalábbal való érintkezést!**

Aprendo l’unità vengono emesse radiazioni laser. **Non fissare il fascio, non guardarlo direttamente con strumenti ottici e evitare l’esposizione diretta al fascio.**

Открывая, берегитесь лазерного излучения. **Не смотрите на луч, не разглядывайте его с помощью оптических инструментов, а также избегайте прямого воздействия лазерного луча.**

Ked je laserová jednotka otvorená. Vyhnite sa priamemu pohľadu a nehľadte priamo s optickými nástrojmi do lúča a vyhnite sa priamemu vystaveniu lúčov.

Radiación láser al abrir. **No mire fijamente ni examine con instrumental óptico el haz de luz. Evite la exposición directa al haz.**
DANGER

To avoid a shock hazard, do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.

To avoid shock hazard:
- The power cord must be connected to a properly wired and grounded receptacle.
- Any equipment to which this product will be attached must also be connected to properly wired receptacles.

When possible, use one hand to connect or disconnect signal cables to prevent a possible shock from touching two surfaces with different electrical potentials.

Electrical current from power, telephone, and communications cables is hazardous. To avoid shock hazard, connect and disconnect cables as described following when installing, moving, or opening covers of this product or attached devices.

To Connect
1. Turn Everything OFF.
2. First, attach all cables to devices.
3. Attach signal cables to receptacles.
4. Attach power cord(s) to outlet.
5. Turn device ON.

To Disconnect
1. Turn Everything OFF.
2. First, remove power cord(s) from outlet.
3. Remove signal cables from receptacles.
4. Remove all cables from devices.

NOTE: In the UK, by law, the telephone cable must be connected after the power cord.
NOTE: In the UK, the power cord must be disconnected after the telephone cable.
Caution:
When replacing the battery, use only IBM Part Number 33F8354 or an equivalent type battery recommended by the manufacturer. If your system has a module containing a lithium battery, replace it only with the same module type made by the same manufacturer. The battery contains lithium and can explode if not properly used, handled, or disposed of.

Do not:
- Throw or immerse into water
- Heat to more than 100°C (212°F)
- Repair or disassemble

Dispose of the battery as required by local ordinances or regulations.

Caution:
When a CD-ROM drive is installed, note the following.

Use of controls or adjustments or performance of procedures other than those specified herein might result in hazardous radiation exposure.

Removing the covers of the CD-ROM drive could result in exposure to hazardous laser radiation. There are no serviceable parts inside the CD-ROM drive. Do not remove the CD-ROM drive covers.

DANGER

Some CD-ROM drives contain an embedded Class 3A or Class 3B laser diode. Note the following.

Laser radiation when open. Do not stare into the beam, do not view directly with optical instruments, and avoid direct exposure to the beam.
Caution:
Use safe lifting practices when lifting your machine.

Caution:
The Power Control button on the front of the server
does not turn off the electrical current supplied to the
server. The server also might have more than one
power cord. To remove all electrical current from the
server, ensure that all power cords are disconnected
from the power source.

Caution:
When the power cord bracket option is installed on the
power cord, the server must be plugged to a power
source that is easily accessible.

Caution:
When unlocked, the server door will not support the
weight of the server. To avoid personal injury, be sure
to remove or lock the server door before moving or
lifting the server.
Caution: Never remove the cover on a power supply or any part (power backplane and AC box) that has the following label attached.

Hazardous voltage, current, and energy levels are present inside the power supplies, power backplane, and AC box. There are no serviceable parts inside the power supplies, power backplane, or AC box. If you suspect a problem with one of these parts, contact an IBM service technician.

Caution: Electrical current from power, telephone, and communication cables can be hazardous. To avoid personal injury or equipment damage, disconnect the attached power cords, telecommunications systems, networks, and modems before you open the server covers, unless instructed otherwise in the installation and configuration procedures.

Caution: The power cable to the fan should be disconnected whenever the fan assembly is not installed in the server; otherwise, the fan might start turning while you are holding it and the fan blades could injure your fingers.

Caution: Do not place any object weighing more than 50 kg (110 lbs) on top of the rack model of the server.
Para evitar choques elétricos, não conecte ou desconecte nenhum cabo, nem efetue instalação, manutenção ou reconfiguração deste produto durante uma tempestade com raios.

Para evitar choques elétricos:

- O cabo de alimentação deve ser conectado a um receptáculo corretamente instalado e aterrado.
- Todos os equipamentos aos quais este produto será conectado devem também ser conectados a receptáculos corretamente instalados.

Quando possível, utilize uma das mãos para conectar ou desconectar cabos de sinal, para evitar um possível choque ao tocar duas superfícies com potenciais elétricos diferentes.

A corrente elétrica proveniente de cabos de alimentação, de telefone e de comunicação é perigosa. Para evitar choques elétricos, conecte e desconecte os cabos conforme descrito a seguir, ao instalar, movimentar ou abrir tampas deste produto ou de dispositivos conectados.

Para Conectar

1. DESLIGUE tudo.
2. Conecte primeiro todos os cabos nos dispositivos.
3. Conecte os cabos de sinal nos receptáculos.
4. Conecte o(s) cabo(s) de alimentação nas tomadas.
5. LIGUE o dispositivo.

Para Desconectar

1. DESLIGUE tudo.
2. Remova primeiro o(s) cabo(s) de alimentação das tomadas.
3. Remova os cabos de sinal dos receptáculos.
4. Remova todos os cabos dos dispositivos.
cuidado:
Ao substituir a bateria, utilize apenas o Número de Peça IBM 33F8354 ou um tipo de bateria equivalente recomendado pelo fabricante. Se seu sistema possuir um módulo com uma bateria de lítio, substitua-o apenas pelo mesmo tipo de módulo, produzido pelo mesmo fabricante. A bateria contém lítio e pode explodir se não for utilizada, manuseada e descartada de forma adequada.

Não:
- Jogue ou coloque na água
- Aqueça a mais de 100°C (212°F)
- Conserte nem desmonte.

Descarte a bateria conforme requerido pelas disposições e regulamentações locais.

cuidado:
Quando uma unidade de CD-ROM estiver instalada, observe o seguinte.

A utilização de controles ou ajustes ou a execução de procedimentos diferentes daqueles especificados nesta publicação pode resultar em exposição perigosa à radiação.

A remoção das tampas da unidade de CD-ROM pode resultar em exposição a radiação perigosa de laser. Não existem peças que possam ser consertadas no interior da unidade de CD-ROM. Não remova as tampas da unidade de CD-ROM.

PERIGO

Algumas unidades de CD-ROM contém um diodo de laser da Classe 3A ou da Classe 3B. Observe o seguinte.

Radiação de laser quando aberto. Não olhe diretamente para o feixe de laser, não olhe diretamente com instrumentos óticos, e evite exposição direta ao raio.
cuidado:
Utilize práticas seguras para levantamento de peso ao levantar sua máquina.

cuidado:
O botão de Controle de Energia na parte frontal do servidor não desliga a corrente elétrica fornecida ao servidor. O servidor pode também possuir mais que um cabo de alimentação. Para remover tda a corrente elétrica do servidor, assegure que todos os cabos de alimentação estejam desconectados da fonte de energia.

!  

!  

!  

cuidado:
Quando o suporte do cabo de alimentação estiver instalado no cabo de alimentação, o servidor deve estar conectado a uma fonte de energia de fácil acesso.

cuidado:
Quando destravada, a porta do servidor não suporta o peso do servidor. Para evitar ferimentos pessoais, certifique-se de remover ou travar a porta do servidor antes de mover ou levantar o servidor.
Não remova a tampa de uma fonte de alimentação ou qualquer peça (painel traseiro de força ou AC box) que contenha a seguinte etiqueta.

Níveis perigosos de tensão, corrente e energia estão presentes no interior das fontes de alimentação, painel traseiro de força ou AC box. Não existem peças que possam ser consertadas no interior da fonte de alimentação, painel traseiro de força ou AC box. Se suspeitar de problemas em uma dessas peças, entre em contato com um representante técnico IBM.

A corrente elétrica proveniente de cabos de alimentação, de telefone e de comunicação é perigosa. Para evitar ferimentos pessoais ou danos aos equipamentos, desconecte os cabos de alimentação, sistemas de telecomunicação, redes e modems antes de abrir as tampas do servidor, a menos que receba outras instruções nos procedimentos de instalação e configuração.

O cabo de energia do ventilador deve permanecer desconectado sempre que o conjunto do ventilador não estiver instalado no servidor; caso contrário, o ventilador pode começar a girar enquanto estiver em suas mãos, e as lâminas do ventilador podem ferir seus dedos.

Não coloque qualquer objeto com peso superior a 50 kg (110 lbs) sobre o modelo de gaveta do servidor.
声明 1

![警告图标]

为避免电击危险，请不要在雷雨期间连接或断开任何电缆，或是在此产品的安装，维护或重新配置操作。

为避免电击危险：
- 电缆线必须连接到适当的插座及接地插头。
- 该产品必须连接到所有设备也必须连接到正确接地的插座上。
- 如有可能，请使用一只手连接或断开信号电缆，以避免在接触两个具有不同电位的表面时遭到电击。
- 电源线、电话线以及通信电缆中的电流非常危险，为避免电击，应立即断开或打开本产品或连接设备的外皮，按照下面步骤连接或断开电缆。

<table>
<thead>
<tr>
<th>连接电缆</th>
<th>断开电缆</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. 关闭所有设备。</td>
<td>1. 关闭所有设备。</td>
</tr>
<tr>
<td>2. 首先将所有电缆与设备连接。</td>
<td>2. 首先从电源插座拔下电源线。</td>
</tr>
<tr>
<td>3. 将信号线连接到设备。</td>
<td>3. 从插座拔下信号电缆。</td>
</tr>
<tr>
<td>4. 再连接到电源插座上。</td>
<td>4. 从设备上拔下所有电缆。</td>
</tr>
<tr>
<td>5. 打开设备。</td>
<td></td>
</tr>
</tbody>
</table>

声明 2

![警告图标]

注意！

当更换电池时，仅可使用 IBM 颂号为 3388364 的产品或制造商推荐的同等电池。如果系统中有包含锂电池的模块，则只能使用由相同制造商或同等类型的模块更换。该电池含有可燃物质，如果使用、操作或处理不当会发生爆炸。

不要：
- 将其投入或浸入水中
- 加热超过 100°C（212°F）
- 弃理或拆卸

应按照当地法规和条例对此电池进行处理。

声明 3

![警告图标]

注意！

在已安装 CD-ROM 驱动器的情况下，请注意下面的内容。

不遵循此处指定的控制、调整或操作过程的操作者可能导致危险的辐射泄露。

取下 CD-ROM 驱动器的外盖会导致危险的电磁辐射泄漏。CD-ROM 驱动器内没有可以使用的部件。请不要取下 CD-ROM 驱动器的外盖。
声明4

危険！

一些CD-ROM驱动器包含内置的3A或3B级激光。注意下述内容。

打开驱动器会产生激光辐射。请不要触摸激光镜片。不要使用光学仪器直接聚焦激光束，并且避免直接暴露在激光束下。

声明5

注意！

搬运机器时，请进行安全搬运操作。

声明6

注意！

关闭服务器前的电源控制旋钮并不能完全切断供给服务器的电源。服务器可能有多条电源线。为从服务器断开所有电源，应确保断开所有电源线与电源的连接。

声明7

注意！

当电源线上安装有电源线固定夹或套时，服务器必须插在容易接近的插座上。

声明8

注意！

在未接插时，服务器的门不能支撑服务器的重量，为避免人身伤害，电在移动或搬运服务器前必须取下或锁住服务器的门。

声明9

注意！

切断下电源或任何带有下列标签的部件（电源后挡板和交流电源盒）上的电源。

电源、电源后挡板和交流电源盒内存在危险的电压。不应和触级。电前，电源后挡板和交流电源盒内部未有可以保护和调整的部。件，如果怀疑这些部件之一有问题，请与IBM服务技术人员联系。
声明 10

注意！

电源线、电话线以及通信电缆中的电流非常危险。为避免人身伤害或设备损坏，除在安装和配置过程中特别指明，需在打开服务器外壳前断开并连接的全部电源线、信号线以及网线前。

声明 11

注意！

在将风扇装置安装到服务器上之前，应该断开连接风扇的电源线。否则，可能在您拿起风扇时它就开始旋转，扇叶可能会伤及您的手。

声明 12

注意！

请不要将任何重量超过 50 kg（110 磅）的物体放在抽屉型服务器的顶部。

警告！

为了防止雷击，在雷电期间，请勿连接或拔掉本装置上的任何电缆线，或请勿安装、维修或重新装配本产品。

为了防止雷击：
- 电源线必须连接到接线柱及接地的插座。
- 本产品所连接的设备也必须连接到接线柱及接地的插座。

请勿使用静电消除剂或对抗静电装置，以避免因接触而不同电位的物体，而受到电击。

电源、电话及通信电缆上如有电流通路，为了防止电击，在安装、移动本产品或移离开本产品的盒子或电缆与本产品连接之电缆的盒体时，请按照下列「连接」及「拔掉」电缆操作的步骤操作。

### 连接

1. 接好所有电源。
2. 将所有电源电缆连接到插孔。
3. 将信号电缆连接到传输插座。
4. 将网线连接到网络插孔。
5. 开启电源开关。

### 拔掉

1. 关闭所有电源。
2. 从电源插座拔下所有电源线。
3. 将信号电缆从传输插座拔下。
4. 从网络插孔拔下所有网线。
5. 从插孔拔下所有电缆。
警告 1

警告：更换电池时，只可使用 IBM 零件编号 33FR354 的电池，或制造商建议的相同类型的电池。如您系统中的模块含有锂电池，请使用相同容量电池的相同型号电池。如未正常使用、处理或检查含有锂的电池时，可能造成爆炸。

警告：
- 避免接触水
- 加热温度不得超过 100 度（华氏 212 度）
- 保管或拆解

警告 2

处理废弃电池时，请遵照当地法令进行处理。

警告 3

注意：
安装光碟机时，请注意下列事项：

- 不依此处所指示的控制、调整或处理步骤，恐有触电之虞。

警告 4

危险

光碟机含有依 IEC 3A 或 Class 3B 雷射二极体时，请注意下列事项：

- 避免直接接触雷射光束，使用光碟机时，不要使用光学装置直接观察，且应避免直接暴露在光束下。

警告 5

警告：
提昇机器时，请使用安全提昇措施。

警告 6

注意：
伺服器前面的电浦控制按钮无法复原触发伺服器的电源。非伺服器可能有一条以上的电源线。如要移除伺服器上的所有电源，请确认所有电源线已与电源分离。

警告 7

注意：
如电源线装有接地线，装置上使用电源设备时，所使用的电源必须是与设备容易使用为原则。
注意：

若未上锁，伺服器的門無法支撐伺服器的重量，為避免人員受傷。

移動或提升伺服器之前，請確認已移除或鎖上伺服器的門。
DANGER

Pour éviter tout risque de choc électrique, ne manipulez aucun câble et n'effectuez aucune opération d'installation, d'entretien ou de reconfiguration de ce produit au cours d'un orage.

Pour éviter tout risque de choc électrique :

- Les cordons d'alimentation du présent produit et de tous les appareils qui lui sont connectés doivent être branchés sur des socles de prise de courant correctement câblés et mis à la terre.

Afin d'éviter tout risque de choc électrique provenant d'une différence de potentiel de terre, n'utilisez qu'une main, lorsque cela est possible, pour connecter ou déconnecter les cordons d'interface.

Le courant électrique passant dans les câbles de communication, ou les cordons téléphoniques et d'alimentation peut être dangereux. Pour éviter tout risque de choc électrique, lorsque vous installez ou que vous déplacez le présent produit ou des périphériques qui lui sont raccordés, reportez-vous aux instructions ci-dessous pour connecter et déconnecter les différents cordons.

<table>
<thead>
<tr>
<th>Connexion</th>
<th>Déconnexion</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Mettez les unités hors tension.</td>
<td>1. Mettez les unités hors tension.</td>
</tr>
<tr>
<td>2. Commencez par brancher tous les cordons sur les unités.</td>
<td>2. Commencez pas débrancher les cordons d'alimentation des socles de prise de courant.</td>
</tr>
<tr>
<td>4. Branchez les cordons d'alimentation sur un socle de prise de courant.</td>
<td>4. Débranchez tous les câbles des unités.</td>
</tr>
</tbody>
</table>
attention:
Remplacez la pile usagée par une pile de référence identique exclusivement - voir la référence IBM - ou par une pile équivalente recommandée par le fabricant. Si votre système est doté d'un module contenant une pile au lithium, vous devez le remplacer uniquement par un module identique, produit par le même fabricant. La pile contient du lithium et présente donc un risque d'explosion en cas de mauvaise manipulation ou utilisation.

- Ne la jetez pas à l'eau.
- Ne l'exposez pas à une température supérieure à 100 °C.
- Ne cherchez pas à la réparer ou à la démonter.

Pour la mise au rebut, reportez-vous à la réglementation en vigueur.

DANGER

Certaines unités de CD-ROM contiennent une diode laser de classe 3A ou 3B. Prenez connaissance des informations suivantes :

Rayonnement laser lorsque le carter est ouvert. Evitez de regarder fixement le faisceau ou de l'observer à l'aide d'instruments optiques. Évitez une exposition directe au rayon.

attention:
Si une unité de CD-ROM est installée, prenez connaissance des informations suivantes :

Pour éviter tout risque d'exposition au rayon laser, respectez les consignes de réglage et d'utilisation des commandes, ainsi que les procédures décrites dans le présent document.

Pour éviter une exposition directe au rayon laser, n'ouvrez pas l'unité de CD-ROM. Vous ne pouvez effectuer aucune opération de maintenance à l'intérieur.
attention:
Ce produit pèse un poids considérable. Faites-vous aider pour le soulever.

attention:
Le bouton de mise sous tension/hors tension situé sur la face avant du serveur ne coupe pas l'arrivée de courant électrique à l'intérieur de la machine. Il se peut que votre serveur dispose de plusieurs cordons d'alimentation. Pour isoler totalement le serveur du réseau électrique, débranchez tous les cordons d'alimentation des socle de prise de courant.

attention:
Lorsqu'une patte de fixation du cordon d'alimentation est installée branchez le serveur sur une prise de courant électrique facile d'accès.

attention:
Une fois déverrouillé, le volet du serveur ne supporte pas le poids de ce dernier. Pour éviter tout accident, retirez ou verrouillez le volet du serveur avant de déplacer ou de soulever ce dernier.
Attention:
N’ouvrez jamais le bloc d’alimentation ou tout élément (fond de panier du bloc ou boîtier d’alimentation en courant alternatif) sur lequel est apposé l’étiquette ci-dessous.

Des tensions et des courants dangereux sont présents à l’intérieur des blocs d’alimentation, de leurs fonds de panier et du boîtier d’alimentation en courant alternatif. Ces éléments ne peuvent pas être réparés. Si vous pensez qu’ils peuvent être à l’origine d’un incident, prenez contact avec un technicien de maintenance IBM.

Attention:
Le courant électrique circulant dans les câbles de communication et les cordons téléphoniques et d’alimentation peut être dangereux. Pour votre sécurité et celle de l’équipement, avant de retirer les carters du serveur, mettez celui-ci hors tension et déconnectez ses cordons d’alimentation, ainsi que les câbles qui le relient aux réseaux, aux systèmes de télécommunication et aux modems (sauf instruction contraire mentionnée dans les procédures d’installation et de configuration).

Attention:
Vous devez débrancher le cordon d’alimentation du ventilateur avant d’installer ce dernier dans le serveur, sinon le ventilateur peut se mettre en route et vous risquez de vous blesser.

Attention:
Ne posez pas d’objet dont le poids dépasse 50 kg sur les modèles tiroir de serveur.
VORSICHT

Aus Sicherheitsgründen:
- Gerät nur an eine Schutzkontaktsteckdose mit ordnungsgemäß geerdetem Schutzkontakt anschließen.
- Alle angeschlossenen Geräte ebenfalls an Schutzkontaktsteckdosen mit ordnungsgemäß geerdetem Schutzkontakt anschließen.

Signalkabel möglichst einhändig anschließen oder lösen, um einen Stromschlag durch Berühren von Oberflächen mit unterschiedlichem elektrischem Potential zu vermeiden.

Kabel anschließen
1. Alle Geräte ausschalten und Netzstecker ziehen.
2. Zuerst alle Kabel an Einheiten anschließen.
3. Signalkabel an Anschlußbuchsen anschließen.
4. Netzstecker an Steckdose anschließen.
5. Gerät einschalten.

Kabel lösen
1. Alle Geräte ausschalten.

250 Netfinity Server HMM
achtung:
Eine verbrauchte Batterie nur durch eine Batterie mit der IBM Teilenummer 33F8354 oder durch eine vom Hersteller empfohlene Batterie ersetzen. Wenn Ihr System ein Modul mit einer Lithium-Batterie enthält, ersetzen Sie es immer mit dem selben Modultyp vom selben Hersteller. Die Batterie enthält Lithium und kann bei unsachgemäßer Verwendung, Handhabung oder Entsorgung explodieren. Die Batterie nicht
- mit Wasser in Berührung bringen.
- über 100 °C erhitzen.
- reparieren oder zerlegen.

Die örtlichen Bestimmungen für die Entsorgung von Sondermüll beachten.

achtung:

VORSICHT

Manche CD-ROM-Laufwerke enthalten eine eingebaute Laserdiode der Klasse 3A oder 3B. Die nachfolgend aufgeführten Punkte beachten.

achtung:
Beim Anheben der Maschine die vorgeschriebenen Sicherheitsbestimmungen beachten.

achtung:

achtung:
Wenn am Netzkabel eine Kabelhalterung angebracht ist, uß der Server an eine leicht zugängliche Netzsteckdose angeschlossen rden.

achtung:
Bei geöffneter Tür kann die Servertür nicht das Gewicht des Servers tragen. Zur Vermeidung von Verletzungsgefahren vor dem Transportieren oder Anheben des Servers die Servertür abnehmen oder verschließen.
achtung:
Die Abdeckung oder eine Komponente eines Netzteils (Rückwandplatine oder Netzspannungsgehäuse), die wie nachfolgend aufgeführt gekennzeichnet ist, darf keinesfalls entfernt werden.

In Netzteilen, Rückwandplatinen und Netzspannungsgehäusen können gefährliche Spannungen anliegen. In Netzteilen, Rückwandplatinen oder Netzspannungsgehäusen sind keine Teile vorhanden, die vom Benutzer gewartet werden müssen. Besteht der Verdacht, daß an einem dieser Teile ein Fehler aufgetreten ist, ist ein IBM Kundendiensttechniker zu verständigen.

achtung:

achtung:

achtung:
Legen Sie keine Gegenstände, die mehr als 50 kg wiegen, auf das Einschubmodell des Servers.
**PERICOLO**

Per evitare il pericolo di scosse elettriche durante i temporali, non collegare o scollegare cavi, non effettuare l'installazione, la manutenzione o la riconfigurazione di questo prodotto.

Per evitare il pericolo di scosse elettriche:

- collegare il cavo di alimentazione ad una presa elettrica correttamente cablata e munita di terra di sicurezza;
- collegare qualsiasi apparecchiatura collegata a questo prodotto ad una presa elettrica correttamente cablata e munita di terra di sicurezza.

Quando possibile, collegare o scollegare i cavi di segnale con una sola mano per evitare il rischio di scosse derivanti dal contatto con due superfici a diverso potenziale elettrico.

La corrente elettrica circolante nei cavi di alimentazione, del telefono e di segnale è pericolosa. Per evitare scosse elettriche, collegare e scollegare i cavi come descritto quando si effettuano l'installazione, la rimozione o l'apertura dei coperchi di questo prodotto o durante il collegamento delle unità.

<table>

ATTENZIONE:
Quando si sostituisce la batteria, utilizzare solo una batteria IBM o batterie dello stesso tipo o di tipo equivalente consigliate dal produttore. Se il sistema di cui si dispone è provvisto di un modulo contenente una batteria al litio, sostituire tale batteria solo con un tipo di modulo uguale a quello fornito dal produttore. La batteria contiene litio e può esplodere se utilizzata, maneggiata o smaltita impropriamente.

Evitare di:
- Gettarla o immergerla in acqua
- Riscalderla ad una temperatura superiore ai 100°C
- Cercare di ripararla o smaltirla

Smaltire secondo la normativa in vigore (D.Lgs 22 del 5/2/97) e successive disposizioni nazionali e locali.

ATTENZIONE:
Quando è installata un’unità CD-ROM, notare quanto segue:

L’utilizzo di controlli, regolazioni o l’esecuzione di procedure non descritti nel presente manuale possono provocare l’esposizione a radiazioni pericolose.

L’apertura di un’unità CD-ROM può determinare l’esposizione a radiazioni laser pericolose. All’interno dell’unità CD-ROM non vi sono parti su cui effettuare l’assistenza tecnica. Non rimuovere i coperchi dell’unità CD-ROM.

PERICOLO

Alcune unità CD-ROM contengono all’interno un diodo laser di Classe 3A o Classe 3B. Prestare attenzione a quanto segue:

Aprendo l’unità vengono emesse radiazioni laser. Non fissare il fascio, non guardarlo direttamente con strumenti ottici ed evitare l’esposizione diretta al fascio.
ATTENZIONE:
Durante il sollevamento della macchina seguire delle norme di sicurezza.

ATTENZIONE:
Il pulsante del controllo dell'alimentazione situato nella parte anteriore del servente non disattiva la corrente elettrica fornita al servente. Il servente potrebbe anche avere più di un cavo di alimentazione. Per disattivare la corrente elettrica del servente, assicurarsi che tutti i cavi di alimentazione siano scollegati dalla sorgente di alimentazione.

ATTENZIONE:
Quando sul cavo di alimentazione è installata l'opzione di sostegno del cavo, il servente deve essere collocato in prossimità di una presa elettrica facilmente accessibile.

ATTENZIONE:
Se aperto, lo sportello del servente non supporta il peso del servente. Per evitare danni alle persone, assicurarsi di rimuovere o chudiere tale sportello prima di spostare o sollevare il servente.
ATTENZIONE:
Non toglie mai il coperchio di un alimentatore o qualsiasi parte (power backplane e ac box) su cui è apposta la seguente etichetta.

Tensioni pericolose, corrente e livelli di energia sono presenti all’interno degli alimentatori, del power backplane e dell’ac box. All’interno degli alimentatori, del power backplane e dell’ac box non ci sono parti soggette a manutenzione. Se si sospetta un problema in una di queste parti, rivolgersi ad un tecnico di manutenzione IBM.

ATTENZIONE:
La corrente circolante nei cavi di alimentazione, del telefono e di segnale è pericolosa. Per evitare situazioni pericolose per le persone o danneggiamenti all'apparecchiatura, scollegare i cavi di alimentazione, i sistemi di telecomunicazioni, le reti e ed i modem prima di aprire i coperchi del servente se non diversamente indicato nelle procedure di installazione e configurazione.

ATTENZIONE:
Il cavo di alimentazione collegato alla ventola dovrebbe essere scollegato ogni volta che l’assieme ventola non sia installato nel servente; diversamente la ventola si potrebbe attivare mentre la si sta maneggiando e le pale potrebbero provocare ferite le dita.

ATTENZIONE:
Non poggiare oggetti che pesano più di 50 kg sulla parte superiore del servente.
주의: 
비타이터를 교체할 때는 IBM 부품 번호 74P8 또는 제조업체에서 추천하는 동일한 유형의 비타이터를 사용하십시오. 시스템에 리튬 비타이터를 포함하는 모들의 경우 이는 중요한 제조업체에서 생산한 동일한 모델을 사용하는 것으로 교체하십시오. 
비타이터는 건전히 포함되어 있어야 하며 최대 2차의 파생 접촉이 있으면 복합할 수 있습니다.

기울이기 주의사항: 
- 단지거나 물에 담가지 않도록 하십시오. 
- 100°C (212°F) 이상으로 가열하지 않도록 하십시오. 
- 수리하거나 분해하지 않도록 하십시오.

지역 법령이나 규정의 요구에 따라 비타이터를 처분하십시오.
위험

일부 CD-ROM 드라이브에는 클래스 3A 또는 3B 경이 2급
전기파(디자드)이 들어 있습니다. 다음 사항을 반드시 지켜보십시오.

열린 케이지 방사능이 노출됩니다. 광선을 주시하거나 광학 기계를
직접 최대보조 기구를 하고 광선에 노출되지 않도록 하십시오.

주의:
기계를 들 때는 안전하게 들어 올리십시오.

주의 6

주의:
서비스 요약의 전원 케어 버튼을 제도 서비스용으로금지되는 전위가 지나지 않습니다.
또한 서비스에 드러난 전위는 반품되어 있는 경우가 있습니다. 서비스로 주문
전위를 차단하기 위한 모든 전위가 천정으로부터 차단되어 있는지 확인하십시오.

주의 7

주의:
전원 보드도 화살표가 접촉되여 안전하게 설치되어 있어야 하며 서비스는 실속 명세서를 수 있는 전위로
반품되어야 합니다.

주의 8

주의:
서비스 대리점이 정해져 있지 않으면 서비스의 무게를 지지하지 못합니다. 단지 정해진
서비스를 이용하거나 올리기 전에 서비스 대리점이 제공하거나 임금상사로.
주의:
전원, 전화 및 통신 케이블로부터 물체 나온다는 것이에
는 위험합니다. 절연 및 구성을 작업해
드른 지시가 없으면, 디지털 또는 통신 케이블 끝에
위험 부재가 있는지 확인한 후에 절연 및 구성을 작업하
드는 것이 좋습니다. 전화, 통신 시스템, 네트워크 및 모델의 만남을 일으킬 수 있습니다.

경고문 11

주의:
봐야 전화된 전선은 전 부도가 서버 배선단에 있지 않을 때에는 연결이 필요해야 합니다. 그럴지 않으면 허를 갖고 있는 곳에 빠져 화재하여 손가락에 상처를 줄 수 있습니다.

경고문 12

주의:
서버 옆의 서버 상단에는 50kg(110 파운드)이 붓는 물체를 높이 놓지 않도록 하십시오.
PELIGRO

Para evitar una posible descarga eléctrica, no conecte ni desconecte los cables ni lleve a cabo ninguna operación de instalación, de mantenimiento o de reconfiguración de este producto durante una tormenta eléctrica.

Para evitar una posible descarga:

- El cable de alimentación debe conectarse a un receptáculo con una instalación eléctrica correcta y con toma de tierra.
- Los aparatos a los que se conecte este producto también deben estar conectados a receptáculos con la debida instalación eléctrica.

Cuando sea posible, utilice una sola mano para conectar o desconectar los cables de señal a fin de evitar una posible descarga al tocar dos superficies con distinto potencial eléctrico.

La corriente eléctrica de los cables de comunicaciones, teléfono y alimentación puede resultar peligrosa. Para evitar una posible descarga, siga las indicaciones de conexión y desconexión de los cables siempre que tenga que instalar, mover o abrir las cubiertas de este producto o de los dispositivos acoplados.

### Instrucciones de conexión

1. Apague todos los componentes (OFF).
2. En primer lugar, conecte todos los cables a los dispositivos.
3. Conecte los cables de señal a los receptáculos.
4. Conecte los cables de alimentación a las tomas.
5. Encienda el dispositivo (ON).

### Instrucciones de desconexión

1. Encienda todos los componentes (ON).
2. En primer lugar, retire los cables de alimentación de las tomas.
3. Retire los cables de señal de los receptáculos.
4. Retire todos los cables de los dispositivos.
percaución:
Al cambiar la batería, utilice únicamente la batería IBM Número de pieza 33F8354 o un tipo de batería equivalente recomendado por el fabricante. Si el sistema tiene un módulo que contiene una batería de litio, sustitúyalo únicamente por el mismo tipo de módulo del mismo fabricante. La batería contiene litio y puede explotar si no se utiliza, manipula o desecha correctamente.

Lo que no debe hacer
• Tirar o sumergir el producto en agua.
• Exponer el producto a una temperatura superior a 100°C.
• Reparar o desmontar el producto.

Cuando quiera desechar la batería, siga las disposiciones y reglamentaciones locales.

percaución:
Cuando instale una unidad de CD-ROM, tenga en cuenta la siguiente información.
Si se llevan a cabo controles o ajustes o se utilizan métodos que no se atengan a lo aquí especificado, se puede producir una exposición peligrosa a las radiaciones.
Si se retiran las cubiertas de la unidad de CD-ROM, se puede producir una peligrosa exposición a radiaciones de láser. Dentro de la unidad de CD-ROM no existen piezas reparables. No retire las cubiertas de la unidad de CD-ROM.

PELIGRO
Algunas unidades de CD-ROM tienen incorporado un diodo de láser de Clase 3A o de Clase 3B. Tenga en cuenta la siguiente información.
Cuando la unidad está abierta se generan emisiones de rayos láser. No dirija la mirada al haz, no lo observe directamente con instrumentos ópticos y evite la exposición directa.
percaución:
Alce la máquina con cuidado; el sobrepeso podría causar alguna lesión.

percaución:
El botón de control de alimentación del panel frontal del servidor no apaga la corriente eléctrica suministrada al servidor. Puede suceder que el servidor tenga más de un cable de alimentación. Para eliminar por completo la corriente eléctrica del servidor, asegúrese de desconectar todos los cables de alimentación del suministro de alimentación.

percaución:
Cuando la opción de soporte del cable de alimentación está instalada en el cable de alimentación, el servidor debe estar conectado a un suministro de alimentación de fácil acceso.

percaución:
Si no está cerrada, la puerta del servidor no soportará el peso del mismo. A fin de evitar lesiones, antes de alzar el servidor o cambiarlo de sitio, extraiga la puerta o ciérrela bien.
percaución:  
No retire nunca la cubierta de una caja de alimentacion ni de ninguna otra pieza (como el cajetín de corriente alterna o la placa posterior de alimentación) que tenga la siguiente etiqueta.

Las cajas de alimentación, las placas posteriores de suministro y los cajetines de CA contienen niveles peligrosos de voltaje, de corriente y de energía. Ninguna de las piezas internas de las cajas de alimentación, de la placa posterior o del cajetín de CA son reparables por el usuario. Si detecta algún problema con alguna de esas piezas, póngase en contacto con un técnico de IBM.

percaución:  
La corriente eléctrica de los cables de comunicaciones, de teléfono y de alimentación puede resultar peligrosa. Para evitar posibles lesiones o daños del aparato, desconecte los cables de alimentación, los sistemas de telecomunicaciones, las redes y los módems antes de abrir las cubiertas del servidor, salvo que se indique lo contrario en las instrucciones de las operaciones de instalación y configuración.

percaución:  
Si el dispositivo de ventilación no está instalado en el servidor, debe desconectar el cable de alimentación que va a parar al ventilador; de lo contrario, podría empezar a funcionar mientras lo sostiene y las hojas podrían causarle alguna lesión.

percaución:  
No coloque ningún objeto cuyo peso sea superior a los 50 kilos sobre la bandeja modelo del servidor.
Send Us Your Comments!

We want to know your opinion about this manual (part number 09N1052). Your input will help us to improve our publications.

Please photocopy this survey, complete it, and then fax it to IBM HMM Survey at 919-543-8167 (USA).

Name

Phone Number

1. Do you like this manual?
   □ Yes    □ No

2. What would you like to see added, changed, or deleted in this manual?

3. What is your service experience level?
   □ Less than five years
   □ More than five years

4. Which Servers do you service most?

Thanks in advance for your response!
Problem Determination Tips

Due to the variety of hardware and software combinations that can be encountered, use the following information to assist you in problem determination. If possible, have this information available when requesting assistance from Service Support and Engineering functions.

- Machine type and model
- Processor or hard disk upgrades
- Failure symptom
  - Do diagnostics fail?
  - What, when, where, single, or multiple systems?
  - Is the failure repeatable?
  - Has this configuration ever worked?
  - If it has been working, what changes were made prior to it failing?
  - Is this the original reported failure?
- Reference/Diagnostics Diskette Version
  - Type and version level
- Hardware configuration
  - Print (print screen) configuration currently in use
  - BIOS level
- Operating system software
  - Type and version level

Important

To eliminate confusion, identical systems are considered identical only if they:

1. Are the exact machine type and models
2. Have the same BIOS level
3. Have the same adapters/attachments in the same locations
4. Have the same address jumpers/terminators/cabling
5. Have the same software versions and levels
6. Have the same Reference/Diagnostics Diskette (version)
7. Have the same configuration options set in the system
8. Have the same setup for the operation system control files

Comparing the configuration and software set-up between “working and non-working” systems will often lead to problem resolution.
Phone Numbers, U.S. and Canada

Note
EMEA customers should contact their Dealer or IBM Service organization.

Before you place a call to the Support Center, refer to “Problem Determination Tips” on page 266.
