Preface
This manual contains information for users of the Seagate® Medalist Pro SCSI disc drives. It provides support services, performance specifications, and initial setup information. Additional information is available in the Medalist Pro Product Manual (part number 32661-001). Contact your Seagate sales representative if you need to order this publication.

Handling precautions

• Disc drives are fragile. Do not drop or jar the drive. Use a padded surface during installation to avoid damaging the drive.

• Keep the drive in its antistatic bag until you are ready to install it.

• Protect the drive from static discharge by making sure you are well grounded before touching the drive. We recommend wearing a grounded wrist strap (Seagate part number 12263496) throughout the installation process. Do not touch the connectors or any part of the printed circuit board.

• Always handle the drive by its edges or frame.

• Do not apply pressure or attach labels to the circuit board or the top of the drive.
Electrostatic discharge protection

Caution. Removal of circuit boards by personnel not performing depot repair will damage components and may void the warranty.

All drive electronic assemblies are sensitive to static electricity, due to the electrostatically sensitive devices used within the drive circuitry. Although some devices such as metal-oxide semiconductors are extremely sensitive, all semiconductors, as well as some resistors and capacitors, may be damaged or degraded by exposure to static electricity.

Electrostatic damage to electronic devices may be caused by the direct discharge of a charged conductor or by exposure to the static fields surrounding charged objects. To avoid damaging drive electronic assemblies, observe the following precautions when installing or servicing the drive:

• Ground yourself to the drive whenever the drive electronics are or will be exposed. Connect yourself to ground with a wrist strap (Seagate part number 12263496). Connection may be made to any grounded metal assembly. As a general rule, remember that you and the drive electronics must all be grounded to avoid potentially damaging static discharges.
• Turn off the power before removing or installing the DC power cable.
• Do not remove any circuit boards from the drive.
• Never use an ohmmeter on any circuit boards.
• When installing the drive on a carrier or tray, discharge the carrier or tray prior to inserting it into the system.
Important safety information and precautions

Caution. Use forced-air ventilation when bench-testing the drive to ensure proper cooling of drive components.

Use proper safety techniques for safe, reliable operation of this unit.

The procedures in this manual and labels on the unit contain warnings and cautions that must be carefully read and followed to minimize or eliminate the risk of personal injury. The warnings point out conditions or practices that may endanger you or others. The cautions point out conditions or practices that may damage the unit, possibly making it unsafe for use.

Always observe the following warnings and precautions:

• Follow all cautions and warnings in the procedures.
• Use sound safety practices when operating, installing, or removing the unit.
• Use caution when troubleshooting a unit that has voltages present. Turn off power to the unit before removing it.
• Ensure that the internal temperature of the rack or cabinet does not exceed the limits defined for the drive when the drive is mounted in an equipment rack or cabinet. When units are stacked vertically, pay special attention to the top where temperatures are usually highest.
• Follow the precautions listed above in “Electrostatic discharge protection.”
• Do not remove any circuit boards from the drive. Return the entire drive for depot repair if any circuit board is defective. Removal of circuit boards by personnel not performing depot repair will damage components and may void the warranty.
• Do not remove the head and disc assembly (HDA) from the
drive. Return the entire drive for depot repair if the HDA is
defective.

• Do not attempt to disassemble the HDA. It is not field repair-
able. If the sealed HDA is opened by personnel not performing
depot repair, this will damage components and void the
warranty.

As a component, this drive is designed to be installed and oper-
ated in accordance with UL1950, EN60950, CSA C22.2 950-
M89, and VDE0805.

Seagate takes all reasonable steps to ensure that its products
are certifiable to currently accepted standards. Typical applica-
tions of these disc drives include customer packaging and sub-
system design. Safety agencies conditionally certify component
assemblies, such as the Medalist disc drive, based on their final
acceptability in the end-use product. The subsystem designers
are responsible for meeting these conditions of acceptability in
obtaining safety-regulatory agency compliance in their end-use
products and for certifying where required by law. A necessary
part of meeting safety requirements is the provision for overcur-
rent protection on drive SELV supply voltages.

This unit is a component part and as such is not meant to com-
ply with FCC or similar national requirements as a stand-alone
unit. Engineering radiated emissions test results are available
through the Seagate Safety Department to assist the subsystem
designer.
Wichtige Sicherheitshinweise

Vorsicht. Beim Testen des Laufwerks auf dem Prüftisch ist Fremdbelüftung vorzusehen, um eine ausreichende Kühlung der Laufwerkkomponenten sicherzustellen.

Verwenden Sie geeignete Sicherheits- um den sicheren, zuverlässigen Betrieb dieser Einheit zu gewährleisten.

Die Warn- und Vorsichtshinweise sind nicht allumfassend! Es ist uns einfach nicht möglich, alle Wartungsmethoden oder die eventuellen Risiken jeder Methode zu kennen, zu beurteilen und Sie entsprechend zu beraten. Aus diesem Grund haben wir auf eine derartige umfassende Beurteilung verzichtet. Falls Sie ein hier nicht beschriebenes Verfahren oder Werkzeug verwenden, stellen Sie zuerst sicher, daß das gewählte Verfahren weder Ihre persönliche Sicherheit noch die Leistung der Einheit gefährdet.

Beachten Sie in jedem Fall die folgenden Warn- und Vorsichtshinweise:

• Beachten Sie alle Warn- und Vorsichtshinweise in diesem Handbuch.
• Treffen Sie beim Betrieb, bei der Installation oder bei der Entfernung der Einheit angemessene Sicherheitsvorkehrungen.

• Wenn eine Einheit unter Spannung steht, gehen Sie bei der Fehlerdiagnose besonders vorsichtig vor. Schalten Sie die Einheit aus, bevor Sie mit den Installations- und Entfernungsarbeiten beginnen.

• Wenn das Laufwerk in einem Einbaugerät oder Gehäuse montiert ist, sorgen Sie dafür, daß die Temperatur im Inneren des Gestells oder Gehäuses die für das Laufwerk vorgegebenen Grenzwerte nicht übersteigt. Wenn Einheiten vertikal übereinander betestigt werden, achten Sie besonders auf den oberen Stapelbereich, da dort die Temperatur gewöhnlich am höchsten ist.

• Befolgen Sie die oben unter “Electrostatic Discharge Protection” angegebenen Sicherheitsmaßnahmen.

• Nehmen Sie keine Platinen aus dem Laufwerk. Wenn eine Platine defekt ist, muß das gesamte Laufwerk zur Reparatur eingeschickt werden. Die Herausnahme von Platinen durch andere Personen als die für die werkseitige Reparatur zuständigen kann zu einer Beschädigung der Komponenten und Erlöschen des Garantieanspruchs führen.

• Die vormontierte Kopf- und Festplatteneinheit (HDA) nicht aus dem Laufwerk nehmen! Falls die HDA beschädigt ist, schicken Sie das gesamte Laufwerk zur Reparatur ein.

• Die HDA ist nicht vor Ort reparierbar und darf nicht auseinander genommen werden! Öffnen der versiegelten HDA durch andere Personen als die für die werkseitige Reparatur zustän-
digem hat eine Beschädigung der Komponenten und Erlöschen des Garantieanspruchs zur Folge.

Als Teilkomponente ist dieses Laufwerk für die Installation und den Betrieb in Übereinstimmung mit UL 1950, EN60950, CSA C22.2 950-M89 und VDE0805 vorgesehen.

Regulatory agency compliance

Electromagnetic susceptibility
As a component assembly, the drive is not required to meet any susceptibility performance requirements. It is the responsibility of those integrating the drive within their systems to perform those tests required and design their system to ensure that equipment operating in the same system as the drive or external to the system does not adversely affect the performance of the drive. See Table 2a, DC power requirements.

Electromagnetic compliance
Seagate uses an independent laboratory to confirm compliance to the directives/standard(s) for CE Marking and C-Tick Marking. The drive was tested in a representative system for typical applications. The selected system represents the most popular characteristics for test platforms. The system configurations include:

- 486, Pentium, and PowerPC microprocessors
- 3.5-inch floppy disc drive
- Keyboard
- Monitor/display
- Printer
- External modem
- Mouse

Although the test system with this Seagate model complies to the directives/standard(s), we cannot guarantee that all systems will comply. The computer manufacturer or system integrator shall confirm EMC compliance and provide CE Marking and C-Tick Marking for their product.
Electromagnetic compliance for the European Union

Australian C-Tick
If this model has the C-Tick Marking it complies with the Australia/New Zealand Standard AS/NZS3548 1995 and meets the Electromagnetic Compatibility (EMC) Framework requirements of Australia’s Spectrum Management Agency (SMA).

SeaBOARD® is a computer bulletin board system that contains information about Seagate disc and tape drive products and is available 24 hours daily. Set your communications software to eight data bits, no parity and one stop bit (8-N-1). This service is available worldwide.

Automated Services

SeaFONE® (1-800-SEAGATE) is Seagate's toll-free number (1-800-732-4283) to access our automated self-help services. Using a touch-tone phone, you can find answers to service
phone numbers, commonly asked questions, troubleshooting tips and specifications for disc drives and tape drives 24 hours daily. International callers can reach this service by dialing 1-405-936-1234.

*SeaFAX®* is Seagate's automated FAX delivery system. Using a touch-tone phone, you can obtain technical support information by return FAX 24 hours daily. This service is available worldwide.

**Presales Support**

Our Presales Support staff can help you determine which Seagate products are best suited for your specific application or computer system.

*Seagate Express*

You can purchase select tape products and tape accessories through Seagate Express 24 hours daily by calling 1-800-531-0968 or by faxing your order to: 1-972-481-4812.

**Technical Support**

If you need help installing your drive, consult your dealer. Dealers are familiar with their unique system configurations and can help you with system conflicts and other technical issues. If you need additional help, you can talk to a Seagate technical support specialist. Before calling, note your system configuration and drive model number (STxxxx).

*SeaTDD™*(1-405-936-1687) is a telecommunications device for the deaf (TDD). You can send questions or comments 24 hours daily and exchange messages with a technical support specialist.
from 8:00 A.M. to 12:15 P.M. and 1:30 P.M. to 6:00 P.M. (central
time) Monday through Friday.

Customer Service (CSO)

Warranty Repair
Seagate offers worldwide customer support for Seagate drives.
Seagate direct OEM, Distribution and System Integrator custom-
ers should contact their Seagate service center representative
for warranty information. Other customers should contact their
place of purchase.

Authorized Service Centers
If you live outside the U.S., you can contact an Authorized Ser-
vice Center for service or repair.

General description

Medalist Pro SCSI disc drives are high-speed, random-access digital-data storage devices.

The drive is a component for installation in an enclosure designed for the drive. This is often a rack within the system or an external enclosure designed to house one or more disc drives or other peripheral units. In either case, the disc drive must receive adequate cooling (refer to “Providing adequate cooling”) and it must be sufficiently grounded and shielded from emissions. The Medalist Pro Product Manual (part number 32661-001) contains guidelines for a properly designed enclosure.

*Model “N” version with 50-pin SCSI I/O connector

Recording
- Cylinders (user): 9,006
- Read/write data heads:
  - ST39140: 8
  - ST36530: 6
  - ST34520: 4

Access time [2]
- Average read: 9.5 msec
- Average write: 10.5 msec

Disk rotation
- RPM: 7,200 r/min
- Average latency: 4.17 msec

Internal transfer rate (variable with zone)
- ST39140: 110–193.88 Mbits/sec
- ST36530: 110–193.88 Mbits/sec
- ST34520: 110–193.88 Mbits/sec

Maximum synchronous SCSI transfer rate
- N model: 20 Mbytes/sec
- W/WC models: 40 Mbytes/sec
- LW/LC models: 80 Mbytes/sec

Cache (1 or 3 segments)
- N/W/WC models: 380 Kbytes
- LW/LC models: 860.5 Kbytes
Can be operated according to SCSI-2/SCSI-3 protocols. Referred to also as “SCSI Fast-20” or “Fast-40.”

Includes controller overhead.

**Notes for Tables 2a and 2b.**

[1] Measured with an average reading DC ammeter. Instantaneous +12V current peaks will exceed these values.

[2] A −10% droop is permissible during initial start of the spindle but must return to ±5% before reaching 7,200 RPM. The
±5% must be maintained after the drive signifies that its power-up sequence has been completed and that the drive is able to accept selection by the host initiator.

[4] This condition occurs when the Motor Start option is enabled and the drive has not yet received a Start Motor command.

[6] Operating condition is defined as random seek read operations with a block count of 64.

General Notes for Tables 2a and 2b:

1. Minimum current loading for each supply voltage is not less than 4% of the maximum operating current shown.
2. Use separate ground returns for +5V and +12V supplies.
3. Where power is provided to multiple drives from a common supply, carefully consider individual drive power requirements. Where multiple units are powered on simultaneously, be sure the peak starting current is available to each device.
Table 3 shows the nominal (no tolerance specified) dimensions and weight of the drive.

General information

The following general information topics are discussed:

- SCSI ID jumpers
- Drive termination
- Terminator power
- Interface drivers and data path width notes
- Other applicable jumper options
- Providing adequate cooling
- Mounting the drive and connecting cables
- Formatting the drive

1. This mounting procedure does not apply to “WC” or “LC” model drives. To mount “WC” or “LC” drives, plug the drive into the system’s single connector attachment (SCA) position on the system’s back panel.
SCSI ID jumpers
Each device on the SCSI chain must have a unique SCSI ID. The host system's SCSI controller usually uses the ID that has the highest priority in the SCSI I/O system. This is always ID7. ID0 is lowest priority in an 8-bit I/O system. ID8 is lowest priority in a 16-bit I/O system. The lower priority SCSI IDs are normally used for other SCSI devices such as this Medalist disc drive.

Note. Most SCSI controllers (host adapters) allow you to skip a SCSI ID. For example, you can have ID0, ID1, and ID3 (skipping ID2). Other controllers do not allow this so be sure to refer to your system or controller user's manual for details about its requirements for proper SCSI device installation.

Note. This drive is a SCAM (SCSI Configured Auto Magically) compliant drive. If the system into which you are installing this drive requires SCAM compliant drives, you do not need to be concerned about the drive ID jumper settings, as the system automatically assigns your new drive the ID it wants it to have. The system may or may not use the existing drive ID jumper settings. Setting the drive ID doesn't hurt anything, but is not necessary in a SCAM compliant system.

The Medalist disc drives are factory set with the SCSI ID set at 0. To change the SCSI ID, refer to the appropriate drive section for your model.

If, after completing the installation process, the drive's LED does not show on/off activity when the host is trying to communicate with the drive, a duplicate SCSI ID may be the problem. If this is the case, change the ID so that each device on the SCSI chain
has its own unique ID. Also check your system or controller user’s manual to ensure that you have not violated its SCSI ID numbering recommendations.

**Drive termination**

If you are installing a Medalist drive in a system that has other SCSI devices installed, terminate only the end devices on the SCSI chain. A SCSI “device” is any disc drive, scanner, tape backup unit, or other piece of hardware connected to your system using the SCSI bus.

The top example in Figure 2 shows an internal hard disc at one end of the SCSI bus with the SCSI controller at the other end (both are terminated). The bottom example shows two additional SCSI devices connected externally—this means the SCSI controller is no longer on the end of the SCSI chain and should not be terminated.

**Note.** Some controllers prefer to remain terminated even if they are in the middle of the chain. Also, some controllers treat the internal and external chains as separate logical buses. This means you may need to terminate both the first and last devices on both logical buses to achieve proper termination. If necessary, refer to your system or controller documentation to see how this is handled in your particular system.
For information about how to terminate your drive, refer to the appropriate drive-specific section.

Terminator power
You usually will not need to change this option and can normally leave the drive configured as it was shipped from the factory. For information about how to change the terminator power option on your drive, refer to the appropriate drive-specific section.

I/O circuits and data path widths
“W,” “WC,” “LW,” and “LC” models have a “wide” (16-bit) SCSI data bus rather than the standard (non-wide) 8-bit SCSI data bus; however, you can use these wide drives on a standard (non-wide) 8-bit data bus using a terminated 68-pin to 50-pin SCSI cable (not applicable to “WC” or “LC” drives which are not to be connected into the system via cable).
Figures 3a, 3b, 3c, and 3d show typical drive connections. The following table lists the maximum cable lengths and number of devices with single-ended I/O circuits allowed on a daisy-chain cable for \( \leq 10 \) and \( \leq 20 \) M transfers/sec I/O data transfer rates.

**Table 4a. Interconnect characteristics for single-ended I/O circuits**

[1] For environments where all elements of the bus (cables, device interfaces, environmental noise and other parameters) are controlled to be better than minimally required, it may be possible to extend the path length and device count.

[2] Extending the device count beyond eight requires specification control beyond the minimum specified in the ANSI T10/1302D document. It is recommended that the devices be uniformly spaced between terminators with the end devices located as close as possible to the terminators.

[3] Values specified by data rate shall apply even if a slower data rate is negotiated.
For environments where all elements of the bus (cables, device interfaces, environmental noise and other parameters) are controlled to be better than minimally required, it may be possible to extend the path length and device count.

SCSI devices shall be within a stub length of the termination (.1 meter).

Values specified by data rate shall apply even if a slower data rate is negotiated.

Loads spaced at least 8 inches (20.3 cm) apart (refer to SCSI EPI T10/1143D specification).

See ANSI T10/1302D specification for details.

Figure 3a. Fifty pin I/O connection to drive

Figure 3b. Sixty-eight pin connection to drive
"X" means up to 6 or the maximum allowable number of devices on the SCSI bus. See Table 4a and system documentation.

Figure 3c. Multiple drive connection to host adapter
Do not mix “W” and “LW” model drives on the daisy chain.

“X” means up to 15 or the maximum allowable number of devices on the SCSI bus. See Table 4a and system documentation.

External terminator may not be furnished with drive.

Figure 3d. Multiple-drive connection to host adapter
Note. This drive model plugs directly into a backplane connector and therefore does not use cables.

Figure 3e. Drive model WC or LC with single 80-pin I/O and power connector
**Providing adequate cooling**

The enclosure design must ensure adequate cooling for the drive. The maximum ambient temperature is 50°C.

The drive's product manual (32661-001) describes how to evaluate the air-flow design. The evaluation consists of ensuring that the case temperature of certain critical components remains within acceptable limits during drive operation.

We recommend orienting the drive or directing the air flow in a way that creates the least amount of air-flow resistance while providing air flow above the circuit boards and around the head and disc assembly (HDA). Also, choose the shortest possible path between the air inlet and exit. This minimizes the distance traveled by air that is heated by the drive and by other nearby heat sources.

Figure 4 shows two design approaches with one or more fans used to generate air flow. The air-flow patterns can be created by the fans either pushing or drawing air. The overall flow pattern can be directed from front to back, back to front, or side to side.
Kühlung des Systems

Die Gehäusekonstruktion muß eine ausreichende Kühlung des Laufwerkes gewährleisten. Die Umgebungstemperatur darf maximal 50°C betragen.

Die Produkthandbuch Medalist Pro (Dokument 32661-001) enthalten Anweisungen zur Beurteilung der Luftstromkonstruktion. Die Beurteilung muß sicherstellen, daß sich die Gehäusetemperatur bestimmter kritischer Komponenten bei Laufwerkbetrieb innerhalb zugelassener Grenzen hält.

Wir empfehlen, das Laufwerk so zu orientieren oder den Luftstrom so zu lenken, daß der geringste Luftstromwiderstand erzeugt wird und gleichzeitig ein Luftstrom über den Platinen und um die Kopf- und Festplatteneinheit (HDA) gegeben ist. Wählen Sie einen möglichst kurzen Weg zwischen Lufteinlaß und -auslaß. Dadurch wird die Strecke, die die vom Laufwerk und anderen nahegelegenen Hitzequellen aufgewärmte Luft zurücklegt, auf ein Minimum beschränkt.

Abbildung 4 zeigt zwei Konstruktionsmöglichkeiten, bei denen ein oder mehrere Lüfter den Luftstrom erzeugen. Der Luftstromverlauf wird durch die Lüfter gesteuert, die entweder Luft einblasen oder abziehen. Generell kann der Luftstrom entweder von vorne nach hinten oder von hinten nach vorne verlaufen.
Figure 4. Suggested air flow

**Note.** Air flows in the direction shown (back to front) or in reverse direction (front to back)

**Hinweis.** Luftstrom in der angezeigten Richtung (von vorne nach hinten) oder in umgekehrter Richtung (von hinten nach vorne)

**Note.** Air flows in the direction shown or in reverse direction (side to side)

**Hinweis.** Luftstrom in der angezeigten Richtung oder in umgekehrter Richtung (von Seite zu Seite)
Mounting the drive and connecting cables

Do not touch the connector pins or any components on the control board without observing static-discharge precautions. Always handle the drive by the frame only.

The drive may be mounted in any orientation (horizontally, vertically, and any combination thereof); however, you must ensure that the drive receives adequate air flow for cooling.

1. Mount the drive to the host system’s chassis using four 6-32 UNC screws. Two mounting holes are in each side of the drive and there are four mounting holes in the bottom of the drive.

   The maximum length that the screws should extend into the chassis mounting holes is 0.15 inch (3.81 mm), measured from the outer surface of the chassis. Tighten the screws down evenly. Do not over-tighten or force the screw if it does not seem to screw in easily, because this means the threads are not properly aligned. In this case, back the screw out and try again.

Installation des Laufwerkes und Anschluß der Kabel

Beachten Sie beim Handhaben und Anfassen der Anschlußstifte und Komponenten die Vorsichtsmaßnahmen zur Verhinderung statischer Aufladung. Fassen Sie das Laufwerk nur am Rahmen an.

Das Laufwerk kann in beliebiger Orientierung (horizontal, vertikal oder schräg) installiert werden; jedoch muß dafür gesorgt werden, daß ein ausreichender Luftstrom zur Kühlung des Laufwerkes vorhanden ist.

Gemessen von der Außenfläche des Gehäuses dürfen die Schrauben maximal 3,81 mm in die Befestigungslöcher des Gehäuses hineinragen. Die Schrauben müssen gleichmäßig, jedoch nicht zu fest, angezogen werden. Wenn sich eine Schraube nicht ohne Widerstand einschrauben läßt, sind die Gewinde nicht korrekt aneinander ausgerichtet. In diesem Fall die Schraube nicht in das Gewindeloch forcieren, sondern die Schraube herausnehmen und erneut in das Gewindeloch einführen.

2. Verify that all connections between the drive and the host system are correctly installed.

2. Prüfen Sie, ob alle Verbindungen zwischen dem Laufwerk und dem Host-System korrekt hergestellt sind.

3. Verify that you have correctly installed jumpers.

3. Stellen Sie sicher, daß die Kennungsbrücken installiert sind.

4. Connect the SCSI cable into the drive’s SCSI connector. Take care not to stretch or crimp this cable, and do not block the system’s cooling air flow with the cable.

The drive receives DC power through a 4-pin connector mounted next to the SCSI connector. The output of a power supply must meet SELV (safety extra low voltage) as
defined in IEC 950. Figure 5 provides the pin information for the DC power connector. To connect the DC power cable to the drive, simply insert the cable end into the drive’s DC power connector.

---

**Figure 5. DC power connector**

**Abbildung 5. Gleichstromanschluß**
Note. Signal ground on the power control board (PCB) and the head and disc assembly (HDA) are connected together in this drive and you cannot separate them. The equipment in which you have mounted the drive is connected directly to the HDA and PCB without electrically isolating shock mounts. Maximizing the conductive contact area between HDA ground and system ground may reduce radiated emissions.

If you do not want the system chassis to be connected to the HDA/PCB ground, you must provide a nonconductive (electrically isolating) method of mounting the drive in the host system. This may increase radiated emissions and is the system designer’s responsibility.

Hinweis:

Die Signalerde auf der Stromregelungskarte (PCB) und der Kopf- und Festplatteneinheit (HDA) sind in diesem Laufwerk miteinander verbunden und können nicht getrennt werden. Das Gerät, in das Sie das Laufwerk eingebaut haben, ist ohne elektrisch isolierende Stoßdämpfer direkt an die HDA und PCB angeschlossen. Die elektromagnetische Strahlung kann reduziert werden, indem Sie eine möglichst große leitende Kontaktfläche zwischen der HDA-Erdung und der Systemerfdung vorsehen.

Wenn Sie das Systemgehäuse nicht an die HDA/PCB-Erdung anschließen wollen, müssen Sie das Laufwerk auf nichtleitende Weise (galvanisch isoliert) im Host-Sys-

5. Replace the host system’s cover.

5. Setzen Sie das Gehäuseoberteil des Host-Systems wieder auf.
Notes:
[1] Mounting holes three on each side, 6-32 UNC. Max. screw length into side of drive 0.15 in. (3.81 mm). Screw tightening torque 6.0 in-lb (.675 NM) max with minimum thread engagement of 0.12 in. (3.15 mm).
[2] Mounting holes four on bottom, 6-32 UNC. Max. screw length into bottom of drive 0.15 in. (3.81 mm). Screw tightening torque 6.0 in-lb (.675 NM) max with minimum thread engagement of 0.12 in. (3.15 mm).
[3] Power and interface connectors can extend past the "K" dimension by 0.040 in. (1.02 mm).
[7] Dimensions to Pin 1 of each connector are nominal values.
[9] Although the illustration shows the 50 pin I/O connector drive model, mounting hole locations are the same for all Medalist Pro models.

Figure 6. Mounting configuration dimensions
Formatting the drive

Warning. Formatting a drive erases all user data. Be sure that you understand this principle before formatting any hard disc drive. It is not necessary to format a drive that previously has been used to store data, unless your intention is to erase all user data.

Note. Seagate is not responsible for lost user data.

1. Turn on DC power.
2. Boot the system from a system floppy disc or from a previously installed hard disc drive if there is one.
3. Format the disc drive. Medalist Pro disc drives are designed to operate with a variety of operating systems. Please refer to your system or SCSI controller manual for information about formatting and setting up the drive. Some quick desktop system notes are provided below.

Quick reference desktop system notes

Note. Refer to your system or utility manual for detailed instructions

- DOS. Set the drive type in CMOS to “Zero,” “None,” or “No hard drive installed.” Use FDISK.EXE and FORMAT.EXE. Systems that have operating system Windows 95 release 950B or later do not need to partition the drive.
- Macintosh. Use a third-party drive utility (Apple’s HD Setup utility only works with drives having special Apple firmware).
**Setting the SCSI ID jumpers**

Use the J6 connector to set the SCSI ID (see Figure 7). To change the SCSI ID, install jumpers on the appropriate pins as shown in the illustration.

![Diagram showing N drives and J6 connector](image)

**Figure 7. Setting the SCSI ID on model N drives**
**Terminating the drive**

“N” model drives are terminated with permanently mounted IC active terminators. If you install one of these drives and it is not on the end of the SCSI bus, disable the terminators by removing the jumper “TE” from pins 15 and 16 of connector J2 (see Figure 8). If you install the drive on the end of the SCSI bus, enable termination by installing a jumper on pins 15 and 16 of connector J2.

![Terminating the drive](image)

**Figure 8. Terminating the drive**
**Terminator power**

There are four possible terminator power (TP) configurations for “N” model drives (see Figure 9). You will not normally need to change this option and can leave the drive configured as it was shipped from the factory.

**‘N’ model drives**

<table>

</tr>
</tbody>
</table>

**Note:** TP jumper(s) must always be in one of the configurations shown, even if TE jumper is not installed.

**Figure 9. Setting terminator power jumpers**
Other applicable jumper options
Several other jumper options are available as illustrated.

Figure 10. Additional jumper options
W/LW drives

Setting the SCSI ID jumpers

Use the J6 jumper block to set the SCSI ID (Figure 11). To change the SCSI ID, install jumpers on the appropriate pins as shown in the illustration. Optional connections to switching circuits in host equipment are provided on J1 auxiliary to set the SCSI ID (see Figure 12).

Figure 11. Setting the SCSI ID on model W/LW drives
Figure 12. Using J1-Auxiliary connector for model W/LW drives alternate ID select and LED connection.
Terminating the drive

“W” model drives are terminated with permanently mounted IC active terminators. If you install one of these drives and it is not on the end of the SCSI bus, disable the terminators by removing the jumper “TE” from pins 15 and 16 of connector J2. If you install the drive on the end of the SCSI bus, enable termination by installing a jumper on pins 15 and 16 of connector J2 (see Figure 13).

**Note.** Use active (ANSI SCSI-2 Alternative 2) terminators when terminating the bus.

![Figure 13. Terminating the drive](image-url)
Terminator power

There are four possible terminator power (TP) configurations for “W” model drives (see Figure 14). You will not normally need to change this option and can leave the drive configured as it was shipped from the factory.

Figure 14. Setting terminator power jumpers

Note: TP jumper(s) must always be in one of the configurations shown, even if TE jumper is not installed.
Other applicable jumper options

Other option jumpers are available as illustrated below.

Figure 15. Additional jumper options for W/LW drives
Figure 16. Additional jumper option for LW drives

- A jumper here forces single-ended I/O operation.
- No jumper allows host to select either single-ended or DF operation.
- Term. Power to SCSI Bus (default)
- Host adapter or other device provides term. power to external terminator (default)
**WC/LC drives**

**Setting the SCSI ID jumpers**
The SCSI ID for “WC” and “LC” model drives is normally set over the SCSI bus by the host system using connector contacts 39 (ID0), 40 (ID2), 79 (ID1), and 80 (ID3). Users need not install jumpers to select SCSI ID.

**Terminating the drive**
“WC” and “LC” model drives do not have internal terminators or any other way of adding internal termination to the drive. External termination for these drives is normally supplied by the host equipment when termination is required.
Applicable jumper options
Option jumpers are available as illustrated below.

**Delay Motor Start option**
The host system has complete control over motor start functions. Do not install a jumper on these pins.

**Enable Motor Start option**
The host system has complete control over motor start functions. Do not install a jumper on these pins.

**Write Protect option**
- Write protect = Off (enables writing) (default)
- Write protect = On (disables writing)

**Parity Check option**
- Enable parity check of SCSI bus. (default)
- Disable parity check.

Reserved. These locations may be marked "TE" or "TP" but are reserved.
