(Please see page 102)
About this manual

This manual contains diagnostic information, a Symptom-to-FRU index, service information, error codes, and configuration information for the IBM Netfinity SP Switch Adapter to be used in an IBM Netfinity Server Switch Fabric Solution. The IBM Netfinity Server Switch Fabric Solution consists of a parallel or distributed system of interconnected computers used as a single unified computing resource or solution.

The IBM Netfinity SP Switch is to be used in conjunction with:

- IBM Netfinity TB3 PCI Adapter
- IBM Netfinity SP Switch Fabric Interconnection Cable
- IBM Netfinity 7000 M10

---

Important

This manual is intended for trained servicers who are familiar with IBM Netfinity Server products.

Important Safety Information

Be sure to read all caution and danger statements in this book before performing any of the instructions.

Leia todas as instruções de cuidado e perigo antes de executar qualquer operação.

注意和危险声明 (简体中文)

重要事项：

本书中的所有注意和危险声明之前都有编号，该编号用于英语的注意或危险声明与 Safety Information 一书中可以找到的翻译版本的注意或危险声明进行交叉引用。

例如，如果一个注意声明以编号 1 开始，那么对该注意声明的翻译也出现在 Safety Information 一书中的声明 1 中。

在按说明执行任何操作前，请务必阅读所有注意和危险声明。

General checkout

Note

If you have already used the general checkout procedure for the system you are servicing and received a 425-027-XXX, 425-25X-XXX, or 425-26X-XXX error code, go to “Symptom-to-FRU Index” on page 55.

The server diagnostic programs are stored in upgradable read-only memory (ROM) on the system board. These programs are the primary method of testing the major components of your server: the system board, Ethernet controller, video controller, RAM, keyboard, mouse (pointing device), diskette drive, serial port, and parallel port. You can also use them to test some external devices. If you cannot determine whether a problem is caused by the hardware or by the software, you can run the diagnostic programs to confirm that the hardware is working properly. For more information about these programs, refer to the Hardware Maintenance manual for the system you are servicing.

When you run the diagnostic programs, a single problem might cause several error messages. When this occurs, work to correct the cause of the first error message. After the cause of the first error message is corrected, the other error messages might not occur the next time you run the test.

Note

A system attached to an IBM Netfinity SP Switch is likely to be part of a shared DASD switch fabric. A switch fabric consist of a IBM Netfinity SP Switch and the server it is connected to. When running the diagnostic programs, care must be taken not to effect the operation of the switch fabric by accessing the sharded DASD.

The hard disk test will exercise the shared DASD and may introduce a performance problem or error condition if the rest of the switch fabric is still operational. Physically disconnect the system from the shared DASD switch fabric prior to running the diagnostic programs, or do not run the the hard disk drive test.
Notes

1. For systems that are part of a shared DASD switch fabric, run one test at a time in looped mode. Do not run all tests in looped mode, as this could enable the DASD diagnostic tests.
2. If multiple error codes are displayed, diagnose the first error code displayed.
3. Safety information, see “Safety information” on page 70.
4. For the following problems, refer to the Hardware Maintenance Manual for the system you are servicing.
   - System hangs
   - Power Supply
   - Undetermined problem

001
IS THE SYSTEM PART OF A SWITCH FABRIC?
Yes No

002
Go to General checkout in the Hardware Maintenance manual for the system you are servicing.

003
– Schedule maintenance with the customer. Remove the system from the switch fabric; then, run the TB3 Card diagnostic programs. See “Diagnostics” on page 4.

DID YOU RECEIVE AN ERROR?
Yes No

004
The diagnostics completed successfully. If you still suspect a problem, go to General Checkout in the Hardware Maintenance manual for the system you are servicing.

005
Find the failure system in “Symptom-to-FRU Index” on page 55.
The following instructions describe starting and running the IBM Netfinity SP Host adapter diagnostics. To start the IBM Netfinity SP Host adapter diagnostics:

1. Click **Start → Programs**.
2. Click the program folder where the IBM Netfinity SP Switch Administrator was installed.
3. Double-click **PC-Doctor**. The OK to Continue with Diagnostics window opens.
4. Take the server (node) offline from the cluster. The diagnostic tests are run only on the IBM Netfinity SP Host adapter and the IBM Netfinity SP Switch cable on the individual server (node) and not on the entire cluster. When the diagnostic tests are complete, you must restart the server (node) to reconnect to the cluster.
5. Click **Yes** on the OK to Continue with Diagnostics window. The following diagnostic window opens.
6. Click the **Diagnostics** icon on the left of the PC-Doctor for Windows window to add the **Switch Adapter** icons to the diagnostics window. The diagnostics window is updated with the switch adapter icons.
7. You can run the IBM Netfinity SP Host adapter diagnostic tests collectively or selectively. To collectively run all diagnostic tests that have been defined for the IBM Netfinity SP Host adapter, Double-click the **Switch Adapter** icon representing the IBM Netfinity SP Host adapter you want to test (switch adapter 0 or switch adapter 1). To run the IBM Netfinity SP Host adapter diagnostic tests selectively, continue with the next step.
8. From the PC-Doctor for Windows screen tool bar, click **Test Set**, and click one of the following options:
   - **Run Quick Test Set**: This option is designed to run test modules in a mode that offers maximum diagnostic coverage in the minimum amount of time.
   - **Run Normal Test Set**: This option is a complete set of all diagnostic tests. The normal tests run.
all test modules including the External Wrap Test which requires that you uncable the IBM Netfinity SP Switch and insert a cable wrap plug onto the IBM Netfinity SP Switch cable.

**Note**

The External Wrap Test will not be run in the Run Quick Test Set option.

To customize the settings and types of diagnostic tests, click TestSet → Custom Test Settings The selected test components are run when you select the Run Quick Test Set or the Run Normal Test Set options. The test sets are chosen when you click on the Details buttons.

To browse the log of all test results and events collected during the execution of each test module, from the PC-Doctor for Windows screen Tool Bar, click Windows → Testlog
Features

The IBM Netfinity SP Switch option consists of the following components:

- One (1) eight port switch card.
- Eight (8) interposer cards, one for each port.
- Two (2) 110VAC to 48VDC, N+1 redundant bulk power supplies.
- Two (2) 48VDC to 3.3VDC, N+1 redundant logic power supplies.
- Two (2) redundant fan assemblies, each containing two fans.
- One (1) power backplane card assembly with an external RS485 system management link.
- Two (2) power converter cards
- One (1) control panel with a two row by sixteen character vacuum florescent display (VFD), power indicator, fault indicator, on/off switch, and two display (cursor) control buttons.
- One cable-management tray
- Two (2) RS485 jack assemblies
- Two (2) RS485 cables

The installation requirements are:

- A TB3 card is required for each server (node) in the IBM Netfinity Switch Fabric Solution. The IBM Netfinity TB3 PCI Adapter card is installed into each server (node) and connected to the IBM Netfinity SP Switch by an IBM Netfinity SP Switch Switch Fabric Interconnect (STI) cable.
- The software required for the IBM Netfinity SP Switch and the IBM Netfinity TB3 PCI Adapter card consists of an IBM Netfinity SP Switch device driver (DD), IBM Netfinity TB3 PCI Adapter microcode, and a Fault Service Daemon.

Note

The IBM Netfinity SP Switch and the IBM Netfinity TB3 PCI Adapter card are designed to operate within an IBM Netfinity Switch Fabric Solution. This switch fabric solution requires Microsoft® Windows NT® 4.0 Enterprise Edition with Service Pack 3, Oracle Paralle Server Version 8.0.5.x for Windows NT, IBM Netfinity Fibre Channel RAID Support, Version 6.2 or later, and IBM Netfinity Switch Fabric Enabler, Version 1.1. Please refer to IBM Netfinity Switch Fabric Enabler Hardware and Software Installation Guide for Oracle Parallel Server for a description of the IBM Netfinity Switch Fabric Solution hardware and software installation process.
Additional service information

The following additional service information supports the IBM Netfinity SP Switch:

- “Installing the IBM Netfinity SP Switch software” on page 8.
- “Configuring the IBM Netfinity SP Switch software” on page 15.
- “Starting the Switch Manager Services (SMS) software” on page 17.
- “Configuring a switch fabric using eight IBM Netfinity SP Host adapters on a single switch card” on page 19.
- “Configuring a switch fabric using 12 IBM Netfinity SP Host adapters on dual switch cards” on page 21.
- “Configuring a switch fabric using 14 IBM Netfinity SP Host adapters on dual switch cards” on page 24.
- “Managing the IBM Netfinity SP Switch fabric” on page 27.
- “Using the IBM Netfinity SP Switch Configuration Utility” on page 30.
- “Using the Switch Port Reservation Utility” on page 32.
Installing the IBM Netfinity SP Switch software

Important

- The IBM Netfinity Switch Fabric Enabler software must be installed on each server (node) in the cluster.
- The IBM Netfinity Switch Fabric Enabler software is supported only on an IBM Netfinity 7000 M10 server.
- If you are reinstalling or upgrading the IBM Netfinity Switch Fabric Enabler software, you must uninstall the currently installed release of the software or install the software upgrade into the same subdirectory as the old software.
- If you successfully uninstalled a previous version of the IBM Netfinity Switch Fabric Enabler software and files are left in the subdirectory where the IBM Netfinity Switch Fabric Enabler software was installed, manually remove these files and subdirectories from the computer. If the uninstallation fails, contact IBM for service (see “Problem Determination Tips” on page 103 for instructions on contacting IBM for service).
- If you install an external LAN adapter in the server, it must be the first adapter in the TCP/IP binding order to be used by the IBM Netfinity SP Switch.
- The IBM Netfinity SP Switch software uses the TCP/IP Services file to allow network access to the switch fabric services. A default port number of 6745 is used. If this port number is not available in the TCP/IP Services file, you will be prompted to type a new port number for the IBM Netfinity SP Switch. The same port number must be used on all servers (nodes).
- IBM Netfinity Manager Version 5.2 or later must be installed on the server (node) if you want to manage alerts and error messages through the Netfinity Manager.

Refer to IBM Client Services for Netfinity Manager User’s Guide and IBM Netfinity Manager User’s Guide for information on managing alerts and error messages through the Netfinity Manager software.

Before you begin the software installation, the following items are required:

- At least one IBM Netfinity SP Host adapter in each server (node) in the cluster
- Windows NT 4.0 Enterprise Edition with Service Pack 4 or Service Pack 5 on each server (node)
TCP/IP installed and configured on each server (node)

To install the software for the IBM Netfinity SP Switch, follow these instructions:

1. Insert the IBM Netfinity SP Switch Manager Services Configuration Release 1.5 CD into a server (node) CD-ROM drive.
2. Click Start → Run.
3. In the Open box, type x:\Setup\Install\SETUP.EXE (where x is the CD-ROM drive letter) and press Enter.
   A warning message appears:
   This product is supported only on Netfinity 7000 M10 Systems
   Click Ok to proceed to the Welcome screen.

   **Note**
   You must stop and close any open or running applications before the IBM Netfinity SP Switch Manager Services Configuration Release 1.5 software can be installed.

4. Click Next.
5. Click Yes or No to the license and warranty statement.
6. If you click Yes to the license and warranty statement, proceed to step 7. If you click No, the software installation process will terminate.

   **Note**
   You must have an external LAN adapter installed in the server (node) for a remote software installation.

7. In the Setup Type window, select one of the following:
   - **Compact**: Install the Switch Manager Services (SMS) software and the online documentation for remote switch fabric management.
   - **Custom**: You will be prompted to choose from the following
Switch Manager Services (SMS): With this software you can configure and manage the IBM Netfinity SP Switch fabric from a remote server (or workstation). You must have an external LAN adapter attached to the server (or workstation) to perform a remote Switch Manager Services (SMS) software installation, however an IBM Netfinity SP Host adapter is not required.

IBM SP Device Drivers: These are the IBM Netfinity SP Host adapter device drivers performance tools, and PC-Doctor diagnostics for the IBM Netfinity SP Host adapter. This service must be installed to support a server (node) on an IBM Netfinity SP Switch. At least one IBM Netfinity SP Host adapter must be installed in the server (node). The IBM SP Services option is also required to be installed with this option.

IBM Netfinity SP Switch documentation: This book in an online format.

IBM SP Switch Configuration: This software controls the communication between the RS485 link on the IBM Netfinity SP Switch and the IBM Netfinity Advanced Systems Management PCI adapter in the IBM Netfinity 7000 M10.

IBM SP Services: These are the software service tools for sending alerts to the IBM Netfinity SP Switch via the RS485 bus. This service must be installed if you are installing the IBM SP Switch Configuration option.

**Typical:** Install the IBM Netfinity SP Host adapter device drivers, all IBM SP Switch Administrator software, switch services, switch configuration software, and the IBM Netfinity SP Switch documentation.

8. Click **Next**.
9. If you choose a Custom installation in step 7 on page 9, the Select Components window opens. Otherwise, proceed to step 14 on page 11.
10. Select the components that you want to install by clicking the check boxes next to the component descriptions.

11. Select a destination folder in which to install the IBM Netfinity SP Switch software.
   a. To accept the default path, click **Next** and then proceed to step 16 on page 12.
   b. To select a different directory, click **Browse** and select the desired directory name. Click **OK**.

12. Click **Next**.

13. Proceed to step 16 on page 12.

14. If you choose a Typical installation, select a destination folder in which to install the IBM Netfinity SP Switch software.
   a. To accept the default path, click **Next** and then proceed to step 16 on page 12.
   b. To select a different directory, click **Browse** and select the desired directory name.
   c. Click **OK**.
Note

If you are installing the IBM SP Switch online documentation on the computer and you do not have Adobe Acrobat Reader installed, you will be prompted to install Adobe Acrobat Reader. If you click No on the prompt, the online documentation will not be installed.

15. Click Next.
16. Select a program folder in which to add the IBM Netfinity Switch Fabric Enabler software.

17. Click Next.
18. In the IBM SP Adapter Selection window, choose between a single or dual adapter configuration. If you are installing one IBM Netfinity SP Host adapter in the server, choose Single adapter configuration. If you are installing two IBM Netfinity SP Host adapters in the server, choose Dual adapter configuration.

19. Click Next. The IBM Netfinity SP Host Adapter0 Configuration window opens.
20. Click OK.

If you selected a dual adapter configuration in step 18 on page 12, the IBM Netfinity SP Host Adapter1 Configuration window opens. Click OK.

The following software components are copied to the desired directory for a typical installation:
- IBM Netfinity SP Switch Administrator
- IBM Netfinity SP Switch Configuration Utility
- IBM Netfinity SP Switch Port Reservation Utility

and the Microsoft NT 4.0 Registry Keys are updated.

If the TCP/IP IP addresses have not been configured on the IBM Netfinity SP Host adapters, the Windows NT Network window opens. Update the IP address section and configure TCP/IP in the Network window. All TCP/IP addresses for a single switch fabric should be on the same Subnet Mask. If all network addresses have been configured, proceed with step 22.

Refer to Microsoft Windows NT Installation and User's Guide for detailed instructions for configuring TCP/IP.

21. Click OK when TCP/IP has been configured.

22. Select Yes, I want to restart my computer now when the Restarting Windows window opens.
23. Click **OK**.

**Note**

The server must be restarted for the settings to take effect.

24. Repeat steps 1 on page 9 through step 23 to install the IBM Netfinity SP Switch software on each server (node).
Configuring the IBM Netfinity SP Switch software

**Important**

- To run the Switch Manager Services (SMS) software from a remote location, the remote computer and the primary node must have an external LAN adapter and the remote computer must be connected to the primary node.
- You must configure and start the IBM Netfinity SP Switch fabric before running any additional software applications that access the IBM Netfinity SP Switch interconnect network.
- Configuring a node as a primary node will not degrade the performance on that server while software applications are running.
- Use the Windows NT event viewer to check for problems logged in the event viewer pertaining to the switch fabric.
- Once the switch fabric has been configured, if you change the switch topology, you must shut down and restart each node attached to the IBM Netfinity SP Host adapters, and you must turn the power off (then turn the power on) the IBM Netfinity SP Switch to reset the switch.

This section describes the configuration and management of the Switch Manager Services (SMS) software. The combination of the IBM Netfinity SP Switch, configured and clustered servers (nodes), and cabled hardware topology makes up an IBM Netfinity SP Switch fabric. The IBM Netfinity SP Switch fabric servers (nodes) consist of:

- **One primary node:**
  Manages the status of all servers (nodes) on the switch fabric. The primary node controls the online and offline status of all servers (nodes) on the switch fabric.

- **One backup node:**
  Provides functional failover support for the primary node.

- **Secondary node:**
  All other servers (nodes) attached to the IBM Netfinity SP Switch fabric.

Before you run the Switch Manager Services (SMS) software, make sure that the following services and processes are running:

- **Device Driver:**
  1. Click **Start** → **Settings** → **Control Panel**.
  2. Double-click **Devices**.
  3. Scroll through the list of device drivers and make sure that IBMTB3N and IBMTB3 are started. If
these drivers are not started as Automatic, manually start them.

- **Switch Services:**
  1. Click Start → Settings → Control Panel.
  2. Double-click Services.
  3. Scroll through the list of processes and make sure that IBM TB3 Switch Manager Service is started. If this service is not started as Automatic, manually start it.

- **Switch Manager:**
  1. Using the right mouse button, click the Windows NT task bar.
  2. Select Task Manager.
  3. Click Processes. Scroll through the list of processes and make sure that SwitchMgr is started. There will be one switch manager service started for each IBM Netfinity SP Host adapter installed. If this process is not started, manually start it as a new task. If you have 2 IBM Netfinity SP Host adapters installed, and only one switch manager service is started, stop the switch manager service and manually restart both switch manager services as new tasks.
Starting the Switch Manager Services (SMS) software

**Note**

If no nodes are displayed in the Switch Manager Services (SMS) window, from the Switch Manager Services (SMS) menu bar:

1. Click **View**.
2. Click **Options**. Add the IP address or TCP/IP hostname of an active node within the subnet mask that you expected to see in the Switch Manager Services (SMS) window. See on page 29 for instructions on using the Options component.

To start the Switch Manager Services (SMS) software:

1. Click **Start → Programs**.
2. Click the program folder where the IBM Netfinity SP Switch Administrator was installed.
3. Double-click **IBM Netfinity SP Switch Administrator**.

The IBM Netfinity SP Switch Administrator window opens.

The IBM Netfinity SP Switch Administrator window is composed of three major components or internal windows:

- **Fabric view** - The fabric view window graphically displays all IBM Netfinity SP Switch fabrics, fabric components and unassigned nodes. This window is in the upper left corner of the IBM Netfinity SP Switch Administrator window. Component properties and actions are called from this view. Placing the cursor over a switch fabric, or one of the switch fabric components, will display the component status in a text pop-up window. Right-clicking a fabric icon or other component icon brings-up menu command options.

- **Node view** - The Node view window displays nodes within the selected IBM Netfinity SP Switch fabric. This window is in the upper right portion of the IBM Netfinity SP Switch Administrator window. The node information displayed shows:
  - Node name and IBM Netfinity SP Host adapter occurrence
  - Node number
  - Type of node
  - IBM Netfinity SP Switch IP address
  - External network IP address (if an external network adapter is installed)
  - Node PCI slot number where the IBM Netfinity SP Host adapter is installed
  - Port number where the IBM Netfinity SP Host adapter is attached to the IBM Netfinity SP Switch
- **Message window** - The Message window contains the detailed communication output from the IBM Netfinity SP Switch fabrics. This window is in the bottom portion of the IBM Netfinity SP Switch Administrator window.
Configuring a switch fabric using eight IBM Netfinity SP Host adapters on a single switch card

Note

- The selected node is used as the primary node.
- Assign one node to the switch fabric. All other unassigned nodes that are members of the cabled hardware topology are assigned to the switch fabric when it is started.
- The switch fabric name must be unique.

From the IBM Netfinity SP Switch Administrator window:
1. Using the right mouse button, click a node in the Unassigned nodes list to assign the node to the switch fabric.
2. Click Assign fabric name.
3. The Assign fabric name window opens.

4. Type the name of the IBM Netfinity SP Switch fabric that you want to use. The node that you selected is assigned to this switch fabric.
5. Click OK.
   The Switch Manager Services (SMS) window displays the switch fabric.
6. Using the right mouse button, click the fabric name under the Fabrics folder.
7. Click Configure.
8. The Configure Topology window opens.
   This figure represents a possible eight-node configuration (using one IBM Netfinity SP Host adapter in each node) or a four-node configuration (using two IBM Netfinity SP Host adapters in each node).
9. Select the eight-node configuration from the Topology pull-down list.
10. Type the switch board name that correctly represents the IBM Netfinity SP Switch and IBM Netfinity SP Host adapter wiring configuration. The name can be a total of 18 characters. The last two characters must be /A. The A corresponds to the side of the IBM Netfinity SP Switch where the switch card and interposers are installed. A1 through A8 is stamped above the interposers.
11. Click OK.
12. The Wiring Instructions window opens.
Use the cabling instructions in this window as a guide for the IBM Netfinity SP Host adapter connections from the nodes to the switch card connections (interposers) on the IBM Netfinity SP Switch.

13. Loosen the two thumbscrews holding the two cable-retaining bars on the cable-management tray on the IBM Netfinity SP Switch (one thumbscrew on each cable-retaining bar) and remove the cable-retaining bars. You will replace the cable-retaining bars after you have cabled each node to the IBM Netfinity SP Switch.

14. Using an IBM Netfinity SP Switch cable, attach one end of the cable to the IBM Netfinity SP Host adapter.

15. Lay the other end of the IBM Netfinity SP Switch cable across the cable-retaining block and attach the 50-pin connector to an available interposer card on the rear of the IBM Netfinity SP Switch.

16. Repeat steps 14 and 15 for each cable that you want to attach.

17. Replace the cable-retaining bars.

18. Click OK. You are returned to the IBM Netfinity SP Switch Administrator window. The switch fabric is configured and is ready to be brought online.

19. Using the right mouse button, click the switch fabric name and click On-line. The Start Fabric window opens.

20. In the Fabric Name field, type the fabric name that you assigned in step 2 on page 19.

21. In the Primary field, choose the node that you selected in step 1 on page 19. If you want to assign another primary node, you must assign another node to the switch fabric. See step 1 on page 19 for instructions on assigning nodes to a switch fabric.

22. Select the switch board from the Primary’s Switch Board pull-down list.

23. Select the jack label from the Primary’s Jack Label pull-down list.

24. Select a new backup node name from the Backup pull-down list (or keep the default name).

25. Click OK.

The IBM Netfinity SP Switch is now configured and started. The Switch Manager Services (SMS) window displays the nodes attached to the switch fabric.
Configuring a switch fabric using 12 IBM Netfinity SP Host adapters on dual switch cards

Note
- The IBM Netfinity SP Switch Card Option is required to support this configuration.
- The selected node is used as the primary node.
- Assign one node to the switch fabric. All other unassigned nodes that are members of the cabled hardware topology are assigned to the switch fabric when it is started.
- The switch fabric name must be unique.

From the IBM Netfinity SP Switch Administrator window:
1. Using the right mouse button, click a node in the Unassigned nodes list to assign the node to the switch fabric.
2. Click Assign fabric name.
3. The Assign fabric name window opens.
4. Type the name of the IBM Netfinity SP Switch fabric that you want to use. The node selected is assigned to this switch fabric.
5. Click OK.
   The Switch Manager Services (SMS) window displays the switch fabric.
6. Using the right mouse button, click the fabric name under the Fabrics folder.
7. Click Configure.
8. The Configure Topology window opens.
   This figure represents a possible 12-node configuration on two switch cards with two IBM Netfinity SP Host adapters and two IBM Netfinity SP 0.53 M cables. The second IBM Netfinity SP 0.53 M cable provides improved network throughput for the switch cards.
9. Select the 12-node configuration from the Topology pull-down list.
10. Type the switch board name that correctly represents the IBM Netfinity SP Switch. The name can be a total of 18 characters. The last two characters must be /A or /B. The A or B corresponds to the side of the IBM Netfinity SP Switch where the switch cards and interposers are installed. A1 through A8 and B1 through B8 are stamped into the rear of the IBM Netfinity SP Switch above the installed interposers.
11. Cable one end of the first 0.53 M cable to port A7 and the other end of the cable to port B2. Cable one end of the second 0.53 M cable to port A8 and the other end of the cable to port B1 as specified in the wiring diagram window.

12. Click OK.

13. The Wiring Instructions window opens.

Use the cabling instructions in this window as a guide for the IBM Netfinity SP Host adapter connections from the nodes to the switch card connections (interposers) on the IBM Netfinity SP Switch.

14. Loosen the two thumbscrews holding the two cable-retaining bars on the cable-management tray on the IBM Netfinity SP Switch (one thumbscrew on each cable-retaining bar) and remove the cable-retaining bars. You will replace the cable-retaining bars after you have cabled each node to the IBM Netfinity SP Switch.

15. Using an IBM Netfinity SP Switch cable, attach one end of the cable to the IBM Netfinity SP Host adapter.

16. Lay the other end of the IBM Netfinity SP Switch cable across the cable-retaining block and attach the 50-pin connector to an available interposer card on the rear of the IBM Netfinity SP Switch.

17. Repeat steps 15 and 16 for each cable that you want to attach.

18. Replace the cable-retaining bars.

19. Click OK. You are returned to the IBM Netfinity SP Switch Administrator window. The switch fabric is configured on both IBM Netfinity SP Host adapters and is ready to be brought online. Power-off and then power-on the IBM Netfinity SP Switch to reset the internal switch clock and synchronize the two switch cards.

20. Using the right mouse button, click the switch fabric name and click On-line.

21. The Start Fabric window opens.

22. In the Fabric Name field, type the fabric name that you assigned in step 2 on page 21.

23. In the Primary field, select the node that you chose in step 1 on page 21. If you want to assign another primary node, you must assign another node to the switch fabric. See step 1 on page 21 for instructions on assigning nodes to a switch fabric.

24. Select the switch board from the Primary’s Switch Board pull-down list.

25. Select the jack label from the Primary’s Jack Label pull-down list.

26. Select a new backup node name from the Backup pull-down list (or keep the default name). The primary and backup nodes must not be the same.

27. Click OK.
The IBM Netfinity SP Switch is now configured and started. The Switch Manager Services (SMS) window displays the nodes attached to the switch fabric.
Configuring a switch fabric using 14 IBM Netfinity SP Host adapters on dual switch cards

**Note**
- The IBM Netfinity SP Switch Card Option is required to support this configuration.
- The selected node is used as the primary node.
- Assign one node to the switch fabric. All other unassigned nodes that are members of the cabled hardware topology are assigned to the switch fabric when it is started.
- The switch fabric name must be unique.

From the IBM Netfinity SP Switch Administrator window:

1. Using the right mouse button, click a node in the Unassigned nodes list to assign the node to the switch fabric.
2. Click **Assign fabric name**.
3. The Assign fabric name window opens.
4. Type the name of the IBM Netfinity SP Switch fabric that you want to use. The node name that you typed is assigned to this switch fabric.
5. Click **OK**.
   - The Switch Manager Services (SMS) window displays the switch fabric.
6. Using the right mouse button, click the fabric name under the Fabrics folder.
7. Click **Configure**.
8. The Configure Topology window opens.
   - This figure represents a possible 14-node configuration on two switch cards with two IBM Netfinity SP Host adapters and one IBM Netfinity SP 0.53 M cable.
9. Select 14-node configuration from the Topology pull-down list.
10. Type the switch board name that correctly represents the IBM Netfinity SP Switch. The name can be a total of 18 characters. The last two characters must be /A or /B. The A or B corresponds to the side of the IBM Netfinity SP Switch where the switch cards and interposers are installed. A1 through A8 and B1 through B8 are stamped into the rear of the IBM Netfinity SP Switch above the installed interposers.
11. Cable one end of the 0.53 M cable to port A8 and the other end of the cable to port B1 as specified in the wiring diagram window.
12. Click OK.
13. The Wiring Instructions window opens. Use the cabling instructions in this window as a guide for the IBM Netfinity SP Host adapter connections from the nodes to the switch card connections (interposers) on the IBM Netfinity SP Switch.
14. Loosen the two thumbscrews holding the two cable-retaining bars on the cable-management tray on the IBM Netfinity SP Switch (one thumbscrew on each cable-retaining bar) and remove the cable-retaining bars. You will replace the cable-retaining bars after you have cabled each node to the IBM Netfinity SP Switch.
15. Using an IBM Netfinity SP Switch cable, attach one end of the cable to the IBM Netfinity SP Host adapter.
16. Lay the other end of the IBM Netfinity SP Switch cable across the cable-retaining block and attach the 50-pin connector to an available interposer card on the rear of the IBM Netfinity SP Switch.
17. Repeat steps 15 and 16 for each cable that you want to attach.
18. Replace the cable-retaining bars.
19. Click OK. You are returned to the IBM Netfinity SP Switch Administrator window. The switch fabric is configured on both IBM Netfinity SP Host adapters and ready to be brought online. Power-off and then power-on the IBM Netfinity SP Switch to reset the internal switch clock and synchronize the two switch cards.
20. Using the right mouse button, click the switch fabric name and click On-line.
21. The Start Fabric window opens.
22. In the Fabric Name field, type the fabric name that you assigned in step 2 on page 24.
23. In the Primary field, select the node that you chose in step 1 on page 24. If you want to assign another primary node, you must assign another node to the switch fabric. See step 1 on page 24 for instructions on assigning nodes to a switch fabric.
24. Select the switch board from the Primary's Switch Board pull-down list.
25. Select the jack label from the Primary's Jack Label pull-down list.
26. Select a new backup node name from the Backup pull-down list (or keep the default name). The primary and backup nodes must not be the same.
27. Click OK.
The IBM Netfinity SP Switch is now configured and started. The Switch Manager Services (SMS) window displays the nodes attached to the switch fabric.
Managing the IBM Netfinity SP Switch fabric

Note

Do not run the IBM Netfinity SP Switch Administrator software from a secondary node if the secondary node does not have an external network adapter.

The following commands are available through the Switch Manager Services (SMS) software to manage the IBM Netfinity SP Switch. These switch fabric commands are run from the IBM Netfinity SP Switch Administrator menu bar, or by right-clicking the switch fabric or node in the IBM Netfinity SP Switch Administrator window.

• Command
  – Off-line: This command can be issued on a switch fabric or on an individual server (node). You can use the Off-line command to take a switch fabric offline. The servers (nodes) attached to this switch fabric cannot be accessed through the IBM Netfinity SP Switch while the switch fabric is offline.
  
  Using the right mouse button, click a node to perform the same command on a node instead of a switch fabric:
    - Off-Line: This command will bring a node offline and stop network IP traffic from flowing through this node

  – On-line: This command can be issued on a switch fabric or on an individual server (node). The On-line command brings the switch fabric online and allows the servers (nodes) to send data across the network.
  
  Using the right mouse button, click a node to perform the same command on a node instead of a switch fabric:
    - On-Line: This command will bring a node online and allow network IP traffic to flow through this node

  – Configure: This command can be issued on a switch fabric or on a switch card. This command cannot be issued on an individual server (node). The Configure command opens the Configure Topology window. You can configure the IBM Netfinity SP Switch fabric by following the hardware cabling shown in the window.

  – Properties: This command can be issued only on a switch fabric and cannot be issued on an individual server (node). The Properties command opens the Fabric Properties Discovery window and lists all of the servers (nodes) attached to the switch fabric and the status of the nodes.
- **Assign Fabric**: This command is issued from a server (node) in the Unassigned Node list. This command opens the Assign Fabric Name window. Servers (nodes) are assigned to this switch fabric and can be used after configuration. The assigned fabric name must be unique (unique to other switch fabrics) and cannot exceed 16 characters in length. All unassigned nodes that are members of the cabled hardware topology are assigned to the switch fabric when the switch fabric is started.

- **Exit**: This command closes the IBM Netfinity SP Switch Administrator window. Communication through the IBM Netfinity SP Switch is not interrupted.

**View**

- **Toolbar**: You can use this command to toggle the toolbar on or off. By clicking the icons (located below the menu bar), you can select a direct path or shortcut to the following commands:
  - View Large Icons
  - View Small Icons
  - View Node List
  - View Node Details
  - View Current Messages
  - View All Messages

- **Status Bar**: This command shows or hides the switch fabric status bar located at the bottom of the IBM Netfinity SP Switch Administrator window. The status bar displays the definition of the Menu Bar commands when the mouse pointer highlights the command.

- **Refresh**: This command activates a query on the switch fabric and updates the contents of the IBM Netfinity SP Switch Administrator windows with the latest status of the switch fabric.

- **Large Icons**: This command displays the servers (nodes) in the IBM Netfinity SP Switch Administrator window as large icons.

- **Small Icons**: This command displays the servers (nodes) in the IBM Netfinity SP Switch Administrator window as small icons.

- **List**: This command displays the server (node) names in the IBM Netfinity SP Switch Administrator window.

- **Details**: This command displays the server (node) names in the IBM Netfinity SP Switch Administrator window and displays the server (node):
  - Node number
  - Personality
  - External IP address
  - SP switch IP address
- Node PCI slot number
- Jack label

- **All Messages**: This command displays any messages generated from all of the switch fabrics with network connectivity to the node where the IBM Netfinity SP Switch Administrator is running.

- **Current Messages**: This command displays the messages generated from the selected switch fabric that is managed by the IBM Netfinity SP Switch Administrator.

- **Options**: This command opens the Options window so that you can add or remove network IP addresses or host names. These IP addresses or host names are resolved to a subnet mask and expand the search capability for the IBM Netfinity SP Switch Administrator in relation to other switch fabrics and unassigned nodes. The Default language selection on the Options window selects the language conforming to the code page loaded by the Windows NT operating system. The current supported languages are:
  - English
  - French
  - German
  - Italian
  - Spanish
  - Japanese

Click **OK** to save the selections or click **Cancel** to close this window and keep the default selections.

- **Help**
  - **Help Contents**: This displays a help index.
  - **About**: The version/release of the IBM Netfinity SP Switch Administrator.
Using the IBM Netfinity SP Switch Configuration Utility

Important

1. The IBM Netfinity Advanced Systems Management PCI adapter must be installed in the node and its accompanying device drivers installed and operational before using the IBM Netfinity SP Switch Configuration Utility. The latest device drivers are on the IBM WEB site at:
   http://www.ibm.com/pc/support
   a. Under Select a Brand, click Server.
   b. Under Select the family click IBM Netfinity 7000 M10.
   c. Under Technical information click Downloadable files.
   d. Download the correct device drivers.

For more information on the IBM Netfinity Advanced Systems Management PCI adapter, see the Advanced System Management section of the server library.

2. Take the switch fabric offline before you power-off the IBM Netfinity SP Switch through the configuration utility.

This section describes the IBM Netfinity SP Switch Configuration Utility. To use the configuration utility, the IBM Netfinity Advanced System Management PCI adapter must be installed in the server with an IBM Netfinity Advanced System Management Interconnect Cable option. Using a standard, customer supplied, 10BaseT Ethernet cable, connect one end of the cable to the RS485 port on the rear of the IBM Netfinity SP Switch, and the other end to the Advanced System Management Interconnect Cable option on the server.

Refer to the IBM Netfinity Advanced System Management PCI Adapter Installation Instructions book for information on installing and using the advanced system management adapter.
Refer to the *IBM Netfinity Advanced System Management Interconnect Cable Option* book for information on installing and using the interconnect cable option.

The configuration utility allows communication from a server to an IBM Netfinity SP Switch through the RS485 port and the power backpane. The configuration utility:

- Displays the status of the IBM Netfinity SP Switch
- Turns power on or turns power off to the IBM Netfinity SP Switch
- Changes the name displayed on the IBM Netfinity SP Switch
- Displays any alerts generated by the IBM Netfinity SP Switch
- Displays all IBM Netfinity SP Switch units attached to the RS485 bus.

To start the IBM Netfinity SP Switch Configuration Utility:

1. Click **Start → Programs.**
2. Click the program folder where the IBM Netfinity SP Switch Administrator was installed.
3. Double-click **Switch Configuration Utility.** The Switch Configuration Utility window opens.
4. Choose the task you wish to perform on the IBM Netfinity SP Switch from the buttons provided. The status messages are displayed in the Switch Status window. Any alerts encountered are displayed in the Alerts window. Press the Refresh button for up-to-date status on the selected switch.
Using the Switch Port Reservation Utility

This section describes the IBM Netfinity SP Switch Port Reservation Utility.

To start the Switch Port Reservation Utility:

1. Click Start → Programs.
2. Click the program folder where the IBM Netfinity SP Switch Administrator was installed.
3. Double-click Switch Port Reservation Utility. The IBM Netfinity SP Switch Port Reservation Utility window opens.

The IBM Netfinity SP Switch software uses the TCP/IP Services file to allow network access to the switch fabric services. A default port number of 6745 is used. If this port number is not available in the TCP/IP Services file, use the port reservation utility to assign a new port number for the IBM Netfinity SP Switch Administrator software. The same port number must be used on all servers (nodes).
Locations/Removals

The following information supports the IBM Netfinity SP Switch.

- “Cable management and labeling” on page 34.
- “Installing the IBM Netfinity SP Switch into an IBM 9306 Model 900 PC Server Rack Enclosure” on page 35.
- “Installing an IBM Netfinity SP Host adapter” on page 39.
- “Replacing parts” on page 40.
- “Replacing the B fan assembly” on page 43.
- “Replacing the A power converter card” on page 44.
- “Replacing the B power converter card” on page 45.
- “Replacing the A power supply” on page 46.
- “Replacing the B power supply” on page 47.
- “Servicing the IBM Netfinity SP Switch non-hot-swappable components” on page 48.
- “Replacing the Vacuum Florescent Display (VFD) unit” on page 50.
- “Replacing the Interposers” on page 51.
- “Replacing the switch card” on page 52.
- “Replacing the power backplane” on page 53.
- “Reassembling the IBM Netfinity SP Switch after service” on page 54.
Cable management and labeling

Cable management and labeling are increasingly important. Cable management and labeling needs have expanded from the traditional labeling of network connections to labeling most cable connections among the servers, disk subsystems, multiple network connections, power configurations, and video subsystems. Examples include fibre-channel configurations, server switch fabrics, multiple unique switch fabrics located in the same rack or across multiple racks, and switch fabrics where components might not be physically located in the same room, building, or site.

The necessity for detailed cable management and labeling is due to the complexity of today’s configurations and the potential distances between components. Benefits from more detailed cable management and labeling include:

- Ease of installation
- Ongoing switch fabric and systems management
- Increased serviceability

Be sure to label the cables. Refer to the IBM support Web site at:

http://www.pc.ibm.com/support

1. Click IBM Server Support on the left side of the Web page.
2. Click Hints and Tips on the right side of the Web page.
3. Click Configuration on the right side of the Web page.
4. Click Servers - Cable management and labeling for solutions utilizing racks, n-node switch fabrics or fiber channel for detailed instructions on how to label the IBM Netfinity switch fabric.
Installing the IBM Netfinity SP Switch
into an IBM 9306 Model 900 PC Server Rack Enclosure

The IBM Netfinity SP Switch consists of the following major hardware components:

- One 8-port switch card (an optional 8-port switch card is available separately)
- Eight interposer cards, one for each port on the switch card
- Two power supplies
- Two power converter cards
- Two fan assemblies, each containing two fans
- One power backplane card
- One display panel with a 2-row by 16-character display panel, power indicator, fault indicator, on/off switch, and two display (cursor) control buttons
- One cable-management tray
- Two RS485 jack assemblies

The following steps describe installing an IBM Netfinity SP Switch into an IBM 9306 Model 900 PC Server Rack Enclosure.
Important

- At least one or two servers (nodes) must be in the same rack as the IBM Netfinity SP Switch.
- You must install cage nuts (provided in the IBM Netfinity SP Switch package) in the appropriate holes in the IBM 9306 Model 900 PC Server Rack Enclosure. These cage nuts are required to receive the screws for the IBM Netfinity SP Switch. Use the Cage Nut Insertion Tool (provided in the IBM 9306 Model 900 PC Server Rack Enclosure package) to correctly install the cage nuts.
- Two people might be needed to install the IBM Netfinity SP Switch into the IBM 9306 Model 900 PC Server Rack Enclosure.

Refer to IBM 9306 Model 900 Netfinity Rack Planning and Installation Guide for detailed hardware installation instructions.

1. Review the safety information provided with the IBM server.

2. From the rear of the IBM Netfinity SP Switch, loosen the center-bottom screw with a flat-blade screwdriver.

3. Slide the two cable-management tray hooks (one on each side of the cable-management tray) into the two slots located on the IBM Netfinity SP Switch (located between the two power supplies) and slip the cable-management tray center slot over the screw loosened in step 2. Tighten the center-bottom screw.

4. Select an available 2U slot on the IBM 9306 Model 900 PC Server Rack Enclosure (referred to as the rack).

5. Using the Cage Nut Insertion Tool, install four cage nuts in the rear slots selected (two for the left rail and two for the right rail) and four cage nuts in the front slots selected (two for the left rail and two for the right rail) to hold the screws for the IBM Netfinity SP
Switch rails and proceed to the next step to prepare the left rail (marked L) to be installed in the rack.

6. Loosen the two adjustment screws in the center of the rail to allow the rail to be extended to fit the rack.

7. From the front of the rack, align the bottom-front hole of the rail with the front hole of the slot; then insert and hand tighten the screw provided.

8. From the rear of the rack, adjust the rail to the correct depth of the rack, and align the two rear holes of the rail with the two rear holes on the slot of the rack.

9. Insert two screws (provided with the rails) into the aligned holes and tighten them with a flat-blade screwdriver.

10. Tighten the two rail-adjustment screws to lock the adjusted rail that allows the IBM Netfinity SP Switch to slide along the rails.

11. Repeat steps 6 through 10 to install the right rail (marked R) into the rack.

12. From the front of the rack, slide the IBM Netfinity SP Switch along the previously installed rails (insert the rear of the switch into the rails first).

13. From the front of the rack, align the left and right sides of the IBM Netfinity SP Switch mounting screw holes with the left and right screw holes in the slot (the screw holes are located above the front rail screws). Insert and hand-tighten the screws.
14. Tighten all screws.

**Note**

An APC Smart-UPS or similar uninterruptable power supply is necessary to provide backup electrical power. Refer to *APC Smart-UPS Uninterruptible Power Supply Model 1400/3000* for detailed power connection instructions.

15. From the rear of the IBM Netfinity SP Switch, connect a power cord to the right power supply and a power cord to the left power supply.
Installing an IBM Netfinity SP Host adapter

The following steps describe installing the IBM Netfinity SP Host adapter into an available PCI slot on an IBM Netfinity 7000 M10.

**Important**

1. The Power Control button on the front of the server does not turn off the electrical current supplied to the server. The server also might have more than one power cord. To remove all electrical current from the server, ensure that all power cords are disconnected from the power source. Refer to the IBM Netfinity 7000 M10 Server Library legal and safety information for safety concerns while installing this adapter.

2. If you have configured the server for one IBM Netfinity SP Host adapter and you are upgrading the server with a second IBM Netfinity SP Host adapter, install the second IBM Netfinity SP Host adapter in a PCI slot with a higher PCI bus address. Refer to the I/O components section of the IBM 7000 M10 Server Library for detailed hardware information.

3. If you have installed two IBM Netfinity SP Host adapters in the server, and you want to disable one of the adapters, remove the IBM Netfinity SP Host adapter from the Windows NT properties.
   To remove the adapter properties:
   a. Click Start → Settings → Control Panel.
   b. Double-click Network.
   c. Click Adapters.
   d. Click IBM Netfinity SP Host adapter.
   e. Click Remove.
   Physically remove the IBM Netfinity SP Host adapter from the server.

4. Label the IBM Netfinity SP Switch cables for future reference.

5. The wrap plug that is packaged with the IBM Netfinity SP Switch should be stored in a safe place should diagnostic testing be required.

1. Review the safety information provided with the IBM server.

2. Install an IBM Netfinity SP Host adapter into an available PCI slot in each IBM Netfinity 7000 M10. If you purchased an additional IBM Netfinity SP Host adapter, install it into another available PCI slot in the server.

Refer to the option installation section of the IBM Netfinity 7000 M10 Server Library and to the IBM Netfinity SP Host adapter Installation and User’s Guide for detailed installation instructions.
Replacing parts

The following section provides information on replacing certain failed components in the IBM Netfinity SP Switch.

**Note**

The following components in the IBM Netfinity SP Switch are **hot-swappable** or **hot-swap** components.

- Two power supplies
- Two power converter cards
- Two fan assemblies, each containing two fans
Removing the front bezel

Remove the front IBM Netfinity SP Switch bezel by grasping the ends of the front bezel firmly, and gently pulling it forward, tilting the bezel slightly downwards as you pull it forward.
Replacing the A fan assembly

1. Remove the front IBM Netfinity SP Switch bezel by grasping the ends of the front bezel firmly, and gently pulling it forward, tilting the bezel slightly downwards as you pull it forward.
2. With a Philips-head screwdriver, loosen the two screws located to the left and right of the A fan assembly (labelled "A" fan assembly).
3. Grasp the tab in the top center of the A fan assembly and gently pull the A fan assembly forward.
4. Replace the A fan assembly and reverse the previous procedures to reassemble the IBM Netfinity SP Switch.
Replacing the B fan assembly

1. Remove the front IBM Netfinity SP Switch bezel by grasping the ends of the front bezel firmly, and gently pulling it forward, tilting the bezel slightly downwards as you pull it forward.
2. Remove the display panel assembly by loosening the screw (located to the right of the display panel) with a Philips-head screwdriver.
3. Swing the display panel from right to left on the hinged-support to free a path to remove the B fan assembly.
4. With a Philips-head screwdriver, loosen the two screws located to the left and right of the B fan assembly (labelled "B" fan assembly).
5. Grasp the tab in the top center of the B fan assembly and gently pull the B fan assembly forward.
6. Replace the B fan assembly and reverse the previous procedures to replace the display panel and reassemble the IBM Netfinity SP Switch.
Replacing the A power converter card.

1. Follow the procedures in section “Removing the front bezel” on page 41 to remove the front bezel and section “Replacing the A fan assembly” on page 42 to remove the A fan assembly.
2. Pull the power converter card bracket levers (one to the right and one to the left of the power converter card bracket) forward simultaneously to release the adapter from the power backplane and gently slide the entire power converter card bracket forward and out of the power converter card bracket rails holding it.
3. Slide the new power converter card along the power converter card bracket rails until contact is made with the power backplane.
4. Simultaneously close the power converter card bracket levers (one to the right and one to the left of the power converter card bracket) by pressing forward on them until they latch securely.
5. Replace the A fan assembly and reassemble the IBM Netfinity SP Switch.
Replacing the B power converter card

1. Follow the procedures in section “Removing the front bezel” on page 41 to remove the front bezel and section “Replacing the B fan assembly” on page 43 to remove the B fan assembly.

2. Pull the power converter card bracket levers (one to the right and one to the left of the power converter card bracket) forward simultaneously to release the adapter from the power backplane and gently slide the entire power converter card bracket forward and out of the power converter card bracket rails holding it.

3. Slide the new power converter card along the power converter card bracket rails until contact is made with the power backplane.

4. Simultaneously close the power converter card bracket levers (one to the right and one to the left of the power converter card bracket) by pressing forward on them until they latch securely.

5. Replace the B fan assembly and reassemble the IBM Netfinity SP Switch.
Replacing the A power supply

Note
Each power supply is keyed to fit into the rear of the IBM Netfinity SP Switch in only one way.

1. At the rear of the IBM Netfinity SP Switch, on the side marked "A", unplug the power cord to the power supply.
2. Loosen the two screws on the power supply with a Philips-head screwdriver.
3. Grasp the tab at the top center of the power supply and firmly pull the power supply straight out of the IBM Netfinity SP Switch.
4. Replace with a new power supply and tighten the two screws provided.
5. Plug in the power cord.
Replacing the B power supply

Note
Each power supply is keyed to fit into the rear of the IBM Netfinity SP Switch in only one way.

1. At the rear of the IBM Netfinity SP Switch, on the side marked “B”, unplug the power cord to the power supply.
2. Loosen the two screws on the power supply with a Philips-head screwdriver.
3. Grasp the tab at the top center of the power supply and firmly pull the power supply straight out of the IBM Netfinity SP Switch.
4. Replace with a new power supply and tighten the two screws provided.
5. Plug in the power cord.
   • One display panel
   • Eight interposers
   • One switch card
   • One power backplane
Servicing the IBM Netfinity SP Switch
non-hot-swappable components

Important

1. To service components in the IBM Netfinity SP Switch that are not hot-swappable, you must power-down the IBM Netfinity SP Switch and remove all cables (including any power cables and any IBM Netfinity SP Switch cables) from the rear of the IBM Netfinity SP Switch.
2. If you are required to uncable the IBM Netfinity SP Switch for service, it is important for you to have labelled the cables at this time. Please refer to section “Cable management and labeling” on page 34 in this document for cable management.
3. You are not required to uncable the IBM Netfinity SP Switch when servicing the Vacuum Fluorescent Display (VFD).

The following service procedures require that the IBM Netfinity SP Switch and each server (node) be powered-down. Please follow these instructions to power-down the servers (nodes) and the IBM Netfinity SP Switch.

1. Shutdown each server (node) in the switch fabric.
2. At the completion of each server (node) shutdown, power-down the IBM Netfinity SP Switch.
3. Unplug the power cords from their supply source.
4. From the rear of the rack where the IBM Netfinity SP Switch is installed, remove the power cords from each of the power supplies.
5. Unplug and remove each of the IBM Netfinity SP Switch cables.
6. From the front of the rack, loosen the left IBM Netfinity SP Switch mounting screw from the left rail and remove it.
7. Loosen the right IBM Netfinity SP Switch mounting screw from the right rail and remove it.
8. Remove the front IBM Netfinity SP Switch bezel by grasping the ends of the front bezel firmly, and gently pulling it forward, tilting the front bezel slightly downwards as you pull it.
9. From the front of the rack and IBM Netfinity SP Switch, slide the IBM Netfinity SP Switch forward along the rails and remove it from the rack. Place the IBM Netfinity SP Switch on a flat stable surface, such as a work table, to service the unit.
10. With a flat-blade screwdriver, remove the four screws that hold the top front IBM Netfinity SP Switch cover (two screws on each side of the IBM Netfinity SP Switch).
11. With a flat-blade screwdriver, remove the two screws from each rear corner of the rear IBM Netfinity SP Switch ventilated cover.

12. Lift and remove the rear IBM Netfinity SP Switch ventilated cover first.

13. Lift and remove the IBM Netfinity SP Switch front cover next.

14. The following internal servicable parts can now be removed.

- See “Replacing the Vacuum Florescent Display (VFD) unit” on page 50.
- See “Replacing the Interposers” on page 51.
- “Replacing the switch card” on page 52.
- “Replacing the power backplane” on page 53.
Replacing the Vacuum Florescent Display (VFD) unit

To replace the Vacuum Florescent Display (VFD) in the IBM Netfinity SP Switch, please follow these instructions:

1. Power-down the IBM Netfinity SP Switch.
2. Remove the front IBM Netfinity SP Switch bezel by grasping the ends of the front bezel firmly, and gently pulling it forward, tilting the front bezel slightly downwards as you pull it.
3. Loosen the VFD screw (located to the right of the VFD) with a Philips-head screwdriver.
4. Swing the VFD from right to left on the VFD hinged-support away from the IBM Netfinity SP Switch.
5. Unplug the ribbon cable located in the back of the VFD.
6. Remove the VFD from its hinged-support by tilting the VFD upwards at a forty-five degree angle and removing it from the VFD hinged-support slot on the front frame of the IBM Netfinity SP Switch.
7. Replace the VFD and follow the reverse procedures above to reassemble the IBM Netfinity SP Switch.
Replacing the Interposers

To replace one or more Interposer cards, please follow these instructions:

1. With a Philips-head screwdriver, loosen the top spring-loaded Interposer card screw and remove the failed card.
2. Replace the failed Interposer card by inserting it firmly into the switch card.
3. Tighten the top spring-loaded Interposer screw and proceed to “Reassembling the IBM Netfinity SP Switch after service” on page 54.
Replacing the switch card

To replace the switch card, please follow these instructions:

1. With a Philips-head screwdriver, loosen the top spring-loaded Interposer card screws and remove each Interposer card from the switch card.
2. With a flat-blade screwdriver, remove the six screws (three on each side of the switch card) that hold the switch card onto the IBM Netfinity SP Switch.
3. Remove the failed switch card and replace it with a new card.
4. Reinstall the Interposers.
5. Connect one end of the IBM Netfinity Switch Card cable to the 30-pin connector on the switch card and the other end to the 30-pin connector on the power backplane.
6. Go to “Reassembling the IBM Netfinity SP Switch after service” on page 54.
Replacing the power backplane

After replacing the power backplane and reassembling the IBM Netfinity SP Switch, the box serial number must be programmed into the VPD of the new power backplane. For detailed instructions on programming the VPD of the replacement power backplanes, go to the IBM support Web site at:

http://www.ibm.com/pc/support

1. Under Select a Brand, click Server.
2. Under Select your Family, click Clustering.
4. Click All.
5. Click IBM Netfinity Switch - Programming box serial number in the VPD of a replacement power backplane.

To replace the power backplane, please follow these instructions:

1. Unplug the VFD ribbon cable from the front left of the power backplane.
2. Unplug the power supply cables from the left and right sides of the power backplane.
3. Unplug the fan assembly power cables from the left and right sides of the power backplane.

Attention

To avoid bending the locating pins on power backplane, unplug the power converter card(s) before you remove the power backplane screws.

4. Unplug the power backplane from each power converter card, remove the failed power backplane and replace it with a new card.
5. Remove the nine screws (3 located on the front of the card, 2 located in the middle of the card, and 4 on the back edge of the card) that hold the power backplane onto the IBM Netfinity SP Switch.
6. Recable the new power backplane.
7. Go to “Reassembling the IBM Netfinity SP Switch after service” on page 54.
Reassembling the IBM Netfinity SP Switch after service

After you have replaced any failed components, please follow these steps to reassemble the IBM Netfinity SP Switch.

1. Replace the top front IBM Netfinity SP Switch cover.
2. With a flat-blade screwdriver, insert and tighten the four screws that hold the top front IBM Netfinity SP Switch cover (two screws on each side of the IBM Netfinity SP Switch).
3. Replace the rear IBM Netfinity SP Switch ventilated cover.
4. With a flat-blade screwdriver, insert and tighten the two screws from each rear corner of the rear IBM Netfinity SP Switch ventilated cover.
5. Reinsert the IBM Netfinity SP Switch into the IBM 9306 Model 900 PC Server Rack Enclosure and reinsert and tighten all screws.

Refer to section “Installing the IBM Netfinity SP Switch into an IBM 9306 Model 900 PC Server Rack Enclosure” on page 35 in this document for rack hardware installation instructions.
6. From the rear of the rack, recable the IBM Netfinity SP Switch. Follow the cable labeling procedures that were established from the “Cable management and labeling” on page 34 section in this document.
7. From the rear of the rack, connect each power cord to the power supplies located in the rear of the IBM Netfinity SP Switch.
8. The IBM Netfinity SP Switch is now ready for use.
Symptom-to-FRU Index

This index supports IBM Netfinity SP Switch.

Notes

1. Check the configuration before you replace a FRU. Configuration problems can cause false errors and symptoms.
2. For IBM devices not supported by this index, refer to the manual for that device.
3. Always start with “General checkout” on page 2.

The Symptom-to-FRU Index lists symptoms, errors, and the possible causes. The most likely cause is listed first. Use this Symptom-to-FRU Index to help you decide which FRUs to have available when servicing the computer.

Error codes

In the following error codes, X can be any number or letter.

<table>
<thead>
<tr>
<th>Error Code/Symptom</th>
<th>FRU/Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>425-027-XXX</td>
<td>1. Cannot open device driver; install device driver</td>
</tr>
<tr>
<td>(Switch Adapter Configuration/Setup Error)</td>
<td></td>
</tr>
<tr>
<td>425-025X-XXX</td>
<td>1. Device driver error; reinstall device driver</td>
</tr>
<tr>
<td>(Failed Switch Adapter Test)</td>
<td>2. Diagnostic software error; reinstall diagnostics</td>
</tr>
<tr>
<td>425-026X-XXX</td>
<td>1. Hardware error; replace Switch Adapter PCI Card</td>
</tr>
<tr>
<td>(Failed Switch Adapter Test)</td>
<td></td>
</tr>
</tbody>
</table>
**Error symptoms**

The following table lists some error symptoms that might occur. The first column contains a description of the problem. The second column contains a brief explanation of the problem. The last column provides a course of actions to resolve the problem.
<table>
<thead>
<tr>
<th>Error Symptom</th>
<th>Explanation</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cannot communicate with a <strong>Secondary Node</strong>, but the server (node) is listed as part of the switch fabric in the Switch Manager Services (SMS).</td>
<td>This node was either disconnected from the IBM Netfinity SP Switch or there was a problem with the Switch Manager Services (SMS) and the <strong>Primary Node</strong> could not be informed.</td>
<td>Verify the physical cable connections between the <strong>Secondary Node</strong> and the IBM Netfinity SP Switch, and then reboot the <strong>Secondary Node</strong>. After a five minute wait, if the <strong>Secondary Node</strong> has not rejoined the switch fabric.</td>
</tr>
<tr>
<td>No <strong>Primary</strong> or <strong>Backup</strong> node is listed in the Switch Manager Services (SMS), but the <strong>Secondary Node</strong> can communicate in the Switch Manager Services (SMS).</td>
<td>Either the <strong>Primary</strong> and <strong>Backup</strong> nodes have been disconnected from the IBM Netfinity SP Switch or there has been a failure in the Switch Manager Services (SMS) on both the <strong>Primary</strong> and <strong>Backup</strong> nodes.</td>
<td>Verify the physical cable connections between the <strong>Primary</strong> and <strong>Backup</strong> nodes and the IBM Netfinity SP Switch, and then reboot the <strong>Primary</strong> and <strong>Backup</strong> nodes. Recreate the switch fabric on your original <strong>Primary</strong> node. If a problem occurs creating the switch fabric using your original <strong>Primary</strong> and <strong>Backup</strong> nodes, create the switch fabric on a <strong>Secondary Node</strong>. After the switch fabric has been created, if the previously defined <strong>Primary</strong> and <strong>Backup</strong> nodes do not join the switch fabric.</td>
</tr>
<tr>
<td>Error Symptom</td>
<td>Explanation</td>
<td>Action</td>
</tr>
<tr>
<td>--------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IBM Netfinity SP Switch configuration error: error code xxx-yyy, from every server (node) in the switch fabric when an Estart command is issued.</td>
<td>All ports in the IBM Netfinity SP Switch are in an “Offline” state due to a Primary or Backup node reboot without first issuing a Stop command.</td>
<td>Shutdown all servers (nodes) and power-down the IBM Netfinity SP Switch (to recycle the IBM Netfinity SP Switch). At shutdown completion on all servers (nodes), power-on the IBM Netfinity SP Switch and restart all servers (nodes). This will clear all status codes in the IBM Netfinity SP Switch and allow the IBM Netfinity SP Switch to restart normally.</td>
</tr>
</tbody>
</table>
Vacuum Florescent Display (VFD) messages
The information that can be displayed in the VFD is limited to the following:

- Information messages from the IBM Netfinity SP Switch Configuration Utility
- Error and information messages from the IBM Netfinity SP Switch Subsystem

The following table describes information messages. The first column contains the message displayed on the VFD. The second column contains a brief explanation of the message. The last column provides a course of action:

<table>
<thead>
<tr>
<th>Information Message</th>
<th>Explanation</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Netfinity M3529 S/N xxxxxxx</td>
<td>The IBM Netfinity SP Switch model number and serial number are displayed, where xxxxxxxx is the machine serial number.</td>
<td>Any error messages detected will replace this message on the IBM Netfinity SP Switch display panel.</td>
</tr>
<tr>
<td>&lt;KEEP&gt;Remind Clr</td>
<td>All functions are displayed on the display panel.</td>
<td>Press the Scroll button to advance to the desired function. Press Enter to make your selection.</td>
</tr>
</tbody>
</table>

About Error Messages:

When an error condition occurs on the IBM Netfinity SP Switch, the error message is displayed on the first line of the VFD. The second line of the VFD is the action line for error message processing. There are 3 options on the action line of the VFD which are controlled by Scroll and Enter buttons on the front panel. The options are:

1. **Keep** to retain the message on the VFD and enable the system error light to continue to flash.
2. **Remind** to retain the message on the VFD and enable the system error light to flash slowly.
3. **Clear** to clear the message from the VFD and enable the system error light to stop flashing. An error message will only be cleared when some action is taken and the error is corrected or if the condition no longer exists.
The following table lists the error messages that might appear on the VFD. The first column contains the message displayed on the VFD. The second column contains a brief explanation of the problem. The last column provides a course of action to resolve the problem.

Safety information

The following section contains the safety information that you need to be familiar with before servicing an IBM server.

General safety

Follow these rules to ensure general safety:

- Observe good housekeeping in the area of the machines during and after maintenance.
- When lifting any heavy object:
  1. Ensure you can stand safely without slipping.
  2. Distribute the weight of the object equally between your feet.
  3. Use a slow lifting force. Never move suddenly or twist when you attempt to lift.
  4. Lift by standing or by pushing up with your leg muscles; this action removes the strain from the muscles in your back. Do not attempt to lift any objects that weigh more than 16 kg (35 lb) or objects that you think are too heavy for you.
- Do not perform any action that causes hazards to the customer, or that makes the equipment unsafe.
- Before you start the machine, ensure that other service representatives and the customer's personnel are not in a hazardous position.
- Place removed covers and other parts in a safe place, away from all personnel, while you are servicing the machine.
- Keep your tool case away from walk areas so that other people will not trip over it.
- Do not wear loose clothing that can be trapped in the moving parts of a machine. Ensure that your sleeves are fastened or rolled up above your elbows. If your hair is long, fasten it.
- Insert the ends of your necktie or scarf inside clothing or fasten it with a nonconductive clip, approximately 8 centimeters (3 inches) from the end.
- Do not wear jewelry, chains, metal-frame eyeglasses, or metal fasteners for your clothing.
  Remember: Metal objects are good electrical conductors.
- Wear safety glasses when you are: hammering, drilling, soldering, cutting wire, attaching springs, using solvents, or working in any other conditions that might be hazardous to your eyes.
- After service, reinstall all safety shields, guards, labels, and ground wires. Replace any safety device that is worn or defective.
- Reinstall all covers correctly before returning the machine to the customer.
Electrical safety

Caution

Electrical current from power, telephone, and communication cables can be hazardous. To avoid personal injury or equipment damage, disconnect the attached power cords, telecommunication systems, networks, and modems before you open the server covers, unless instructed otherwise in the installation and configuration procedures.

Observe the following rules when working on electrical equipment.

Important

Use only approved tools and test equipment. Some hand tools have handles covered with a soft material that does not insulate you when working with live electrical currents.

Many customers have, near their equipment, rubber floor mats that contain small conductive fibers to decrease electrostatic discharges. Do not use this type of mat to protect yourself from electrical shock.

- Find the room emergency power-off (EPO) switch, disconnecting switch, or electrical outlet. If an electrical accident occurs, you can then operate the switch or unplug the power cord quickly.
- Do not work alone under hazardous conditions or near equipment that has hazardous voltages.
- Disconnect all power before:
  - Performing a mechanical inspection
  - Working near power supplies
  - Removing or installing main units
- Before you start to work on the machine, unplug the power cord. If you cannot unplug it, ask the customer to power-off the wall box that supplies power to the machine and to lock the wall box in the off position.
- If you need to work on a machine that has exposed electrical circuits, observe the following precautions:
  - Ensure that another person, familiar with the power-off controls, is near you.
  - Use only one hand when working with powered-on electrical equipment; keep the other hand in your pocket or behind your back.

Related service information 71
Remember: There must be a complete circuit to cause electrical shock. By observing the above rule, you may prevent a current from passing through your body.

- When using testers, set the controls correctly and use the approved probe leads and accessories for that tester.
- Stand on suitable rubber mats (obtained locally, if necessary) to insulate you from grounds such as metal floor strips and machine frames.

Observe the special safety precautions when you work with very high voltages; these instructions are in the safety sections of maintenance information. Use extreme care when measuring high voltages.

- Regularly inspect and maintain your electrical hand tools for safe operational condition.
- Do not use worn or broken tools and testers.
- Never assume that power has been disconnected from a circuit. First, check that it has been powered-off.
- Always look carefully for possible hazards in your work area. Examples of these hazards are moist floors, nongrounded power extension cables, power surges, and missing safety grounds.
- Do not touch live electrical circuits with the reflective surface of a plastic dental mirror. The surface is conductive; such touching can cause personal injury and machine damage.
- Do not service the following parts with the power on when they are removed from their normal operating places in a machine:
  - Power supply units
  - Pumps
  - Blowers and fans
  - Motor generators
  and similar units. (This practice ensures correct grounding of the units.)
- If an electrical accident occurs:
  - Use caution; do not become a victim yourself.
  - Switch off power.
  - Send another person to get medical aid.

Safety inspection guide
The intent of this inspection guide is to assist you in identifying potentially unsafe conditions on these products. Each machine, as it was designed and built, had required safety items installed to protect users and service personnel from injury. This guide addresses only those items. However, good judgment should be used to identify potential safety hazards due to attachment of non-IBM features or options not covered by this inspection guide.
If any unsafe conditions are present, you must determine how serious the apparent hazard could be and whether you can continue without first correcting the problem.

Consider these conditions and the safety hazards they present:

- Electrical hazards, especially primary power (primary voltage on the frame can cause serious or fatal electrical shock).
- Explosive hazards, such as a damaged CRT face or bulging capacitor
- Mechanical hazards, such as loose or missing hardware

The guide consists of a series of steps presented in a checklist. Begin the checks with the power off, and the power cord disconnected.

Checklist:

1. Check exterior covers for damage (loose, broken, or sharp edges).
2. Power-off the computer. Disconnect the power cord.
3. Check the power cord for:
   a. A third-wire ground connector in good condition. Use a meter to measure third-wire ground continuity for 0.1 ohm or less between the external ground pin and frame ground.
   b. The power cord should be the appropriate type as specified in the parts listings.
   c. Insulation must not be frayed or worn.
4. Remove the cover.
5. Check for any obvious non-IBM alterations. Use good judgment as to the safety of any non-IBM alterations.
6. Check inside the unit for any obvious unsafe conditions, such as metal filings, contamination, water or other liquids, or signs of fire or smoke damage.
7. Check for worn, frayed, or pinched cables.
8. Check that the power-supply cover fasteners (screws or rivets) have not been removed or tampered with.
Handling electrostatic discharge-sensitive devices

Any computer part containing transistors or integrated circuits (ICs) should be considered sensitive to electrostatic discharge (ESD). ESD damage can occur when there is a difference in charge between objects. Protect against ESD damage by equalizing the charge so that the machine, the part, the work mat, and the person handling the part are all at the same charge.

Notes:

1. Use product-specific ESD procedures when they exceed the requirements noted here.
2. Make sure that the ESD protective devices you use have been certified (ISO 9000) as fully effective.

When handling ESD-sensitive parts:

- Keep the parts in protective packages until they are inserted into the product.
- Avoid contact with other people.
- Wear a grounded wrist strap against your skin to eliminate static on your body.
- Prevent the part from touching your clothing. Most clothing is insulative and retains a charge even when you are wearing a wrist strap.
- Use the black side of a grounded work mat to provide a static-free work surface. The mat is especially useful when handling ESD-sensitive devices.
- Select a grounding system, such as those listed below, to provide protection that meets the specific service requirement.

Note: The use of a grounding system is desirable but not required to protect against ESD damage.
- Attach the ESD ground clip to any frame ground, ground braid, or green-wire ground.
- Use an ESD common ground or reference point when working on a double-insulated or battery-operated system. You can use coax or connector-outside shells on these systems.
- Use the round ground-prong of the AC plug on AC-operated computers.

Grounding requirements

Electrical grounding of the computer is required for operator safety and correct system function. Proper grounding of the electrical outlet can be verified by a certified electrician.
DANGER

Para evitar choques elétricos, não conecte ou desconecte nenhum cabo, nem efetue instalação, manutenção ou reconfiguração deste produto durante uma tempestade com raios.

Para evitar choques elétricos:
- O cabo de alimentação deve ser conectado a um receptáculo corretamente instalado e aterrado.
- Todos os equipamentos aos quais este produto será conectado devem também ser conectados a receptáculos corretamente instalados.

Quando possível, utilize uma das mãos para conectar ou desconectar cabos de sinal, para evitar um possível choque ao tocar duas superfícies com potenciais elétricos diferentes.

A corrente elétrica proveniente de cabos de alimentação, de telefone e de comunicação é perigosa. Para evitar choques elétricos, conecte e desconecte os cabos conforme descrito a seguir, ao instalar, movimentar ou abrir tampas deste produto ou de dispositivos conectados.

CAUTION:
Ao substituir a bateria, utilize apenas o Número de
Peça IBM 33F8354 ou um tipo de bateria equivalente
recomendado pelo fabricante. Se seu sistema possuir
um módulo com uma bateria de lítio, substitua-o
apenas pelo mesmo tipo de módulo, produzido pelo
mesmo fabricante. A bateria contém lítio e pode
explodir se não for utilizada, manuseada e descartada
de forma adequada.
Não:
• Jogue ou coloque na água
• Aqueça a mais de 100°C (212°F)
• Conserte nem desmonte.
Descarte a bateria conforme requerido pelas
disposições e regulamentações locais.

CAUTION:
Quando uma unidade de CD-ROM estiver instalada,
observe o seguinte.
A utilização de controles ou ajustes ou a execução de
procedimentos diferentes daqueles especificados
nesta publicação pode resultar em exposição perigosa
a radiação.
A remoção das tampas da unidade de CD-ROM pode
resultar em exposição a radiação perigosa de laser.
Não existem peças que possam ser consertadas no
interior da unidade de CD-ROM. Não remova as
tampas da unidade de CD-ROM.

DANGER
Algumas unidades de CD-ROM contém um
diodo de laser da Classe 3A ou da Classe 3B.
Observe o seguinte.
Radiação de laser quando aberto. Não olhe
diretamente para o feixe de laser, não olhe
diretamente com instrumentos óticos, e evite
exposição direta ao raio.
CAUTION: Utilize práticas seguras para levantamento de peso ao levantar sua máquina.

CAUTION: O botão de Controle de Energia na parte frontal do servidor não desliga a corrente elétrica fornecida ao servidor. O servidor pode também possuir mais que um cabo de alimentação. Para remover toda a corrente elétrica do servidor, assegure que todos os cabos de alimentação estejam desconectados da fonte de energia.

CAUTION: Quando o suporte do cabo de alimentação estiver instalado no cabo de alimentação, o servidor deve estar conectado a uma fonte de energia de fácil acesso.

CAUTION: Não coloque qualquer objeto com peso superior a 50 kg (110 lbs) sobre o modelo de gaveta do servidor.
声明 1

警告！

为避免触电危险，请不要在雷电期间连接或断开任何电线。

为避免触电危险：
- 电缆线必须连接到适当的电缆及插头插座。
- 该产品安装时的所有设备也必须连接到正确连接的插座上。

如果可能，请使用一只手连接或断开连接信号电缆，以避免在接触两个具有不同电势的表面时遭受电击。

电源线、电话线以及通信电缆中的电压非常危险，为避免电击，请在安装、移动或打开本产品或连接设备的外盖时，按照上述步骤连接或断开任何电缆。

表连接电缆

1. 关闭所有设备。
2. 将信号电缆连接到插座。
3. 将电源电缆连接到插座。
4. 将电源线连接到正确插座。
5. 打开设备。

表断开电缆

1. 关闭所有设备。
2. 首先断开电源线插座。
3. 拔去信号电缆插座。
4. 从电源线上拔下所有电缆。

声明 2

注意！

当更换电池时，仅可使用 IBM 部件号为 33F9354 的产品或制造商推荐的同等电池。如果使用电池的危险性模式，则使用由制造商推荐的相同类型模块更换。该电池含有锂，如果使用、操作或处理不当会发生爆炸。

不要：
- 将其投入或投于水中
- 加热超过 100°C（212°F）
- 修理或拆卸

应按照当地法规和条例对此电池进行处理。

声明 3

注意！

在安装 CD-ROM 驱动器的情况下，请注意下面的内容。

不要在此处指定的控制、调整、或操作过程的操作，可能导致危险的辐射泄漏。

取下 CD-ROM 驱动器的外壳会导致危险的激光辐射喷出。CD-ROM 驱动器内没有可以使用的部件，请不要取下 CD-ROM 驱动器的外盖。
声明 4

危险！

声明 5

注意！
搬运机器时，请进行安全搬运操作。

声明 6

注意！
关断服务器前的电源控制按钮并不能完全切断服务器的电源，服务酒店可能有多条电源线，为确保服务器断电，应确保断开所有电源线与电源的连接。

声明 7

注意！
当电源线上安装有电源线固定夹等件时，服务器必须插在容易接近的电源上。

声明 12

注意！
请不要将任何重量超过 50 kg (110 lbs) 巨的物体放在抽屉型服务器的顶部。
警告 1

危险

为了防止触电，在使用期间，请勿连接或拔掉本装置上的任何电气线或请勿安装、维修或重新架设本产品。

为了防止触电：
- 电线须连接到接地或接地良好的插座。
- 本产品所连接的插座也须连接到接地良好的插座。

请使用接地线或接地的装置，以避免因接触而不同电位的平面，而受到电击。

电源、电话及通信电缆上均有电流通过。为了防止电击，在安装、移动本产品或重新架设本产品连接之装置的盖子时，请依下列「连接」及「拆除」步骤，进行连接的步骤操作。

连接
1. 遵守所有规则。
2. 先在电源插座接线。
3. 将插头插入您所使用的插座。
4. 将耳筒插入电话插座。

警告 2

注意

更换电池时，只可使用 IBM 允许使用于 338354 的电池，在使用 12V 电池的型号中，电池的电压须与电池的电压一致。否则，请使用相同电压及相同电容电压的电池。未正确使用，可能会造成损坏。

警告：
- 本产品禁止水浸。
- 若电池温度高于 500 度（华氏 212 度）。
- 请勿拆解。

处理废弃电池时，请遵守当地法令规定处理。

警告 3

注意

安装或移动时，请注意下列事项：
不依此指示及本手册指示的步骤，而进行操作，可能造成触电。

移开线缆时，务请避免线缆接触之危险。光缆线中未有需要维修的部分，请勿移开光缆线。“光缆线”。

警告 4

危险

光缆线含有内芯式 Class 3A 或 Class 3B，请注意以下事项：
- 使用光缆线时，请勿使用裸体，直接操作，以免触电。
Related service information
DANGER

To avoid a shock hazard, do not connect or disconnect any cables or perform installation, maintenance, or reconfiguration of this product during an electrical storm.

To avoid shock hazard:
- The power cord must be connected to a properly wired and earthed receptacle.
- Any equipment to which this product will be attached must also be connected to properly wired receptacles.

When possible, use one hand to connect or disconnect signal cables to prevent a possible shock from touching two surfaces with different electrical potentials.

Electrical current from power, telephone, and communications cables is hazardous. To avoid shock hazard, connect and disconnect cables as described following when installing, moving, or opening covers of this product or attached devices.

**To Connect**

1. Turn Everything OFF.
2. First, attach all cables to devices.
3. Attach signal cables to receptacles.
4. Attach power cord(s) to outlet.
5. Turn device ON.

**To Disconnect**

1. Turn Everything OFF.
2. First, remove power cord(s) from outlet.
3. Remove signal cables from receptacles.
4. Remove all cables from devices.

NOTE: In the UK, by law, the telephone cable must be connected after the power cord. 
NOTE: In the UK, the power cord must be disconnected after the telephone cable.
CAUTION:
When replacing the battery, use only IBM Part Number 33F8354 or an equivalent type battery recommended by the manufacturer. If your system has a module containing a lithium battery, replace it only with the same module type made by the same manufacturer. The battery contains lithium and can explode if not properly used, handled, or disposed of.

Do not:

- Throw or immerse into water
- Heat to more than 100°C (212°F)
- Repair or disassemble

Dispose of the battery as required by local ordinances or regulations.

CAUTION:
When a CD-ROM drive is installed, note the following.

Use of controls or adjustments or performance of procedures other than those specified herein might result in hazardous radiation exposure.

Removing the covers of the CD-ROM drive could result in exposure to hazardous laser radiation. There are no serviceable parts inside the CD-ROM drive. Do not remove the CD-ROM drive covers.

DANGER

Some CD-ROM drives contain an embedded Class 3A or Class 3B laser diode. Note the following.

Laser radiation when open. Do not stare into the beam, do not view directly with optical instruments, and avoid direct exposure to the beam.
CAUTION:
Use safe lifting practices when lifting your machine.

CAUTION:
The Power Control button on the front of the server does not turn off the electrical current supplied to the server. The server also might have more than one power cord. To remove all electrical current from the server, ensure that all power cords are disconnected from the power source.

CAUTION:
When the power cord bracket option is installed on the power cord, the server must be plugged to a power source that is easily accessible.

CAUTION:
Do not place any object weighing more than 50 kg (110 lbs) on top of the rack model of the server.
Pour éviter tout risque de choc électrique, ne manipulez aucun câble et n'effectuez aucune opération d'installation, d'entretien ou de reconfiguration de ce produit au cours d'un orage.

Pour éviter tout risque de choc électrique :
- Les cordons d'alimentation du présent produit et de tous les appareils qui lui sont connectés doivent être branchés sur des socles de prise de courant correctement câblés et mis à la terre.

Afin d'éviter tout risque de choc électrique provenant d'une différence de potentiel de terre, n'utilisez qu'une main, lorsque cela est possible, pour connecter ou déconnecter les cordons d'interface.

Le courant électrique passant dans les câbles de communication, ou les cordons téléphoniques et d'alimentation peut être dangereux. Pour éviter tout risque de choc électrique, lorsque vous installez ou que vous déplacez le présent produit ou des périphériques qui lui sont raccordés, reportez-vous aux instructions ci-dessous pour connecter et déconnecter les différents cordons.

### Connexion
1. Mettez les unités hors tension.
2. Commencez par brancher tous les cordons sur les unités.
4. Branchez les cordons d'alimentation sur un socle de prise de courant.
5. Mettez les unités sous tension.

### Déconnexion
1. Mettez les unités hors tension.
2. Commencez pas débrancher les cordons alimentation des socles de prise de courant.
3. Débranchez les câbles d'interface des prises.
4. Débranchez tous les câbles des unités.
CAUTION:
Remplacez la pile usagée par une pile de référence identique exclusivement - voir la référence IBM - ou par une pile équivalente recommandée par le fabricant.
Si votre système est doté d'un module contenant une pile au lithium, vous devez le remplacer uniquement par un module identique, produit par le même fabricant. La pile contient du lithium et présente donc un risque d’explosion en cas de mauvaise manipulation ou utilisation.

- Ne la jetez pas à l’eau.
- Ne l’exposez pas à une température supérieure à 100 °C.
- Ne cherchez pas à la réparer ou à la démonter.

Pour la mise au rebut, reportez-vous à la réglementation en vigueur.

CAUTION:
Si une unité de CD-ROM est installée, prenez connaissance des informations suivantes :

Pour éviter tout risque d'exposition au rayon laser, respectez les consignes de réglage et d'utilisation des commandes, ainsi que les procédures décrites dans le présent document.

Pour éviter une exposition directe au rayon laser, n'ouvrez pas l'unité de CD-ROM. Vous ne pouvez effectuer aucune opération de maintenance à l'intérieur.
DANGER

Certaines unités de CD-ROM contiennent une diode laser de classe 3A ou 3B. Prenez connaissance des informations suivantes :

Rayonnement laser lorsque le carter est ouvert. Évitez de regarder fixement le faisceau ou de l'observer à l'aide d'instruments optiques. Évitez une exposition directe au rayon.

CAUTION:
Ce produit pèse un poids considérable. Faites-vous aider pour le soulever.

CAUTION:
Le bouton de mise sous tension/hors tension situé sur la face avant du serveur ne coupe pas l’arrivée de courant électrique à l’intérieur de la machine. Il se peut que votre serveur dispose de plusieurs cordons d'alimentation. Pour isoler totalement le serveur du réseau électrique, débranchez tous les cordons d'alimentation des socles de prise de courant.

CAUTION:
Lorsqu’une patte de fixation du cordon d’alimentation est installée, branchez le serveur sur une prise de courant électrique facile d'accès.
CAUTION:
Ne posez pas d'objet dont le poids dépasse 50 kg sur les modèles tiroir de serveur.
DANGER

Aus Sicherheitsgründen:

- Gerät nur an eine Schutzkontaktsteckdose mit ordnungsgemäß geerdetem Schutzkontakt anschließen.
- Alle angeschlossenen Geräte ebenfalls an Schutzkontaktsteckdosen mit ordnungsgemäß geerdetem Schutzkontakt anschließen.

Signalkabel möglichst einhändig anschließen oder lösen, um einen Stromschlag durch Berühren von Oberflächen mit unterschiedlichem elektrischem Potential zu vermeiden.

Kabel anschließen

1. Alle Geräte ausschalten und Netzstecker ziehen.
2. Zuerst alle Kabel an Einheiten anschließen.
3. Signalkabel an Anschlussbuchsen anschließen.
4. Netzstecker an Steckdose anschließen.
5. Gerät einschalten.

Kabel lösen

1. Alle Geräte ausschalten.
CAUTION:

Die Batterie nicht
- mit Wasser in Berührung bringen.
- über 100 C erhitzen.
- reparieren oder zerlegen.

Die örtlichen Bestimmungen für die Entsorgung von Sondermüll beachten.

CAUTION:

DANGER

Manche CD-ROM-Laufwerke enthalten eine eingebaute Laserdiode der Klasse 3A oder 3B. Die nachfolgend aufgeführten Punkte beachten.

CAUTION:
Beim Anheben der Maschine die vorgeschriebenen Sicherheitsbestimmungen beachten.

CAUTION:

CAUTION:
Wenn am Netzkabel eine Kabelhalterung angebracht ist, muß der Server an eine leicht zugängliche Netzsteckdose angeschlossen werden.
CAUTION:
Legen Sie keine Gegenstände, die mehr als 50 kg wiegen, auf das Einschubmodell des Servers.
Per evitare il pericolo di scosse elettriche durante i temporali, non collegare o scollegare cavi, non effettuare l'installazione, la manutenzione o la riconfigurazione di questo prodotto.

Per evitare il pericolo di scosse elettriche:
• collegare il cavo di alimentazione ad una presa elettrica correttamente cablata e munita di terra di sicurezza;
• collegare qualsiasi apparecchiatura collegata a questo prodotto ad una presa elettrica correttamente cablata e munita di terra di sicurezza.

Quando possibile, collegare o scollegare i cavi di segnale con una sola mano per evitare il rischio di scosse derivanti dal contatto con due superfici a diverso potenziale elettrico.

La corrente elettrica circolante nei cavi di alimentazione, del telefono e di segnale è pericolosa. Per evitare scosse elettriche, collegare e scollegare i cavi come descritto quando si effettuano l'installazione, la rimozione o l'apertura dei coperchi di questo prodotto o durante il collegamento delle unità.

<table>

ATTENZIONE:
Quando si sostituisce la batteria, utilizzare solo una batteria IBM o batterie dello stesso tipo o di tipo equivalente consigliate dal produttore. Se il sistema di cui si dispone è provvisto di un modulo contenente una batteria al litio, sostituire tale batteria solo con un tipo di modulo uguale a quello fornito dal produttore. La batteria contiene litio e può esplodere se utilizzata, maneggiata o smaltita impropriamente.

Evitare di:
- Gettarla o immergerla in acqua
- Riscaldarla ad una temperatura superiore ai 100° C
- Cercare di ripararla o smaltirla

Smaltire secondo la normativa in vigore (D.Lgs 22 del 5/2/97) e successive disposizioni nazionali e locali.

ATTENZIONE:
Quando è installata un'unità CD-ROM, notare quanto segue:

L'utilizzo di controlli, regolazioni o l'esecuzione di procedure non descritti nel presente manuale possono provocare l'esposizione a radiazioni pericolose.

L'apertura di un'unità CD-ROM può determinare l'esposizione a radiazioni laser pericolose. All'interno dell'unità CD-ROM non vi sono parti su cui effettuare l'assistenza tecnica. Non rimuovere i coperchi dell'unità CD-ROM.

PERICOLO

Alcune unità CD-ROM contengono all'interno un diodo laser di Classe 3A o Classe 3B.

Prestare attenzione a quanto segue:

Aprendo l'unità vengono emesse radiazioni laser. Non fissare il fascio, non guardarlo direttamente con strumenti ottici ed evitare l'esposizione diretta al fascio.
ATTENZIONE:
Durante il sollevamento della macchina seguire delle norme di di sicurezza.

ATTENZIONE:
Il pulsante del controllo dell'alimentazione situato nella parte anteriore del servente non disattiva la corrente elettrica fornita al servente. Il servente potrebbe anche avere più di un cavo di alimentazione. Per disattivare la corrente elettrica del servente, assicurarsi che tutti i cavi di alimentazione siano scollegati dalla sorgente di alimentazione.

ATTENZIONE:
Quando sul cavo di alimentazione è installata l'opzione di sostegno del cavo, il servente deve essere collocato in prossimità di una presa elettrica facilmente accessibile.

ATTENZIONE:
Non poggiate oggetti che pesano più di 50 kg sulla parte superiore del servente.

위험

일부 CD-ROM 드라이브에는 클래스 3A 또는 3B 전원이 2극 전원플러그(다이나드)이 붙어 있습니다. 다음 사항을 확인하십시오.

열면 전원 방향성이 노출됩니다. 광선을 주시하거나 광학 기계를 직접 최다보지 않도록 하고 광선에 노출되지 않도록 하십시오.

주의:

기계를 들어 전반하게 들어 올리십시오.

경고문 6

주의:

서버 앞쪽의 전원 케이블은 반드시 서버로 근접되는 케이블이 차단되지 않으십시오. 또한 서버에 케이블이 연결되어 있는 경우가 있습니다. 서버에서 모든 전원을 차단해야만 모든 전원이 전장을으로부터 차단되어 있는지 확인하십시오.

경고문 7

주의:

전원 케이블이 전선에 살짝 부착되어 있어 서버는 쉽게 백세스할 수 있는 전장으로 연결되어 있습니다.

경고문 12

주의:

서버 모듈의 서버 닫아서는 50kg(110 파운드)이 넘는 물체를 올려 놓지 않도록 하십시오.
DANGER

Para evitar una posible descarga eléctrica, no conecte ni desconecte los cables ni lleve a cabo ninguna operación de instalación, de mantenimiento o de reconfiguración de este producto durante una tormenta eléctrica.

Para evitar una posible descarga:

- El cable de alimentación debe conectarse a un receptáculo con una instalación eléctrica correcta y con toma de tierra.
- Los aparatos a los que se conecte este producto también deben estar conectados a receptáculos con la debida instalación eléctrica.

Cuando sea posible, utilice una sola mano para conectar o desconectar los cables de señal a fin de evitar una posible descarga al tocar dos superficies con distinto potencial eléctrico.

La corriente eléctrica de los cables de comunicaciones, teléfono y alimentación puede resultar peligrosa. Para evitar una posible descarga, siga las indicaciones de conexión y desconexión de los cables siempre que tenga que instalar, mover o abrir las cubiertas de este producto o de los dispositivos acoplados.

<table>
<thead>
<tr>

</tbody>
</table>
CAUTION:
Al cambiar la batería, utilice únicamente la batería IBM Número de pieza 33F8354 o un tipo de batería equivalente recomendado por el fabricante. Si el sistema tiene un módulo que contiene una batería de litio, sustitúyalo únicamente por el mismo tipo de módulo del mismo fabricante. La batería contiene litio y puede explotar si no se utiliza, manipula o desecha correctamente.

Lo que no debe hacer
- Tirar o sumergir el producto en agua.
- Exponer el producto a una temperatura superior a 100°C.
- Reparar o desmontar el producto.

Cuando quiera desechar la batería, siga las disposiciones y reglamentaciones locales.

CAUTION:
Cuando instale una unidad de CD-ROM, tenga en cuenta la siguiente información.

Si se llevan a cabo controles o ajustes o se utilizan métodos que no se atengan a lo aquí especificado, se puede producir una exposición peligrosa a las radiaciones.

Si se retiran las cubiertas de la unidad de CD-ROM, se puede producir una peligrosa exposición a radiaciones de láser. Dentro de la unidad de CD-ROM no existen piezas reparables. No retire las cubiertas de la unidad de CD-ROM.
DANGER

Algunas unidades de CD-ROM tienen incorporado un diodo de láser de Clase 3A o de Clase 3B. Tenga en cuenta la siguiente información.

Cuando la unidad está abierta se generan emisiones de rayos láser. No dirija la mirada al haz, no lo observe directamente con instrumentos ópticos y evite la exposición directa.

CAUTION:
Alce la máquina con cuidado; el sobrepeso podría causar alguna lesión.

CAUTION:
El botón de control de alimentación del panel frontal del servidor no apaga la corriente eléctrica suministrada al servidor. Puede suceder que el servidor tenga más de un cable de alimentación. Para eliminar por completo la corriente eléctrica del servidor, asegúrese de desconectar todos los cables de alimentación del suministro de alimentación.

CAUTION:
Cuando la opción de soporte del cable de alimentación está instalada en el cable de alimentación, el servidor debe estar conectado a un suministro de alimentación de fácil acceso.
CAUTION:
No coloque ningún objeto cuyo peso sea superior a los 50 kilos sobre la bandeja modelo del servidor.
Send Us Your Comments!

We want to know your opinion about this manual (part number 37L5122). Your input will help us to improve our publications.

Please photocopy this survey, complete it, and then fax it to IBM HMM Survey at 919-543-8167 (USA).

Problem Determination Tips

Due to the variety of hardware and software combinations that can be encountered, use the following information to assist you in problem determination. If possible, have this information available when requesting assistance from Service Support and Engineering functions.

- Machine type and model
- Processor or hard disk upgrades
- Failure symptom
  - Do diagnostics fail?
  - What, when, where, single, or multiple systems?
  - Is the failure repeatable?
  - Has this configuration ever worked?
  - If it has been working, what changes were made prior to it failing?
  - Is this the original reported failure?
- Reference/Diagnostics Diskette Version
  - Type and version level
- Hardware configuration
  - Print (print screen) configuration currently in use
  - BIOS level
- Operating system software
  - Type and version level

**Important**

To eliminate confusion, identical systems are considered *identical* only if they:

1. Are the exact machine type and models
2. Have the same BIOS level
3. Have the same adapters/attachments in the same locations
4. Have the same address jumpers/terminators/cabling
5. Have the same software versions and levels
6. Have the same Reference/Diagnostics Diskette (version)
7. Have the same configuration options set in the system
8. Have the same setup for the operation system control files

Comparing the configuration and software set-up between “working and non-working” systems will often lead to problem resolution.
