Safety Notices

Danger notices appear on the following pages:
- vi
- xii

A caution notice indicates the presence of a hazard that has the potential of causing moderate or minor personal injury.

Caution notices appear on the following pages:
- vi
- xii

Note: For a translation of these notices, see System Unit Safety Information, order number SA23-2652

Electrical Safety

Observe the following safety instructions any time you are connecting or disconnecting devices attached to the workstation.

DANGER

An electrical outlet that is not correctly wired could place hazardous voltage on metal parts of the system or the devices that attach to the system. It is the responsibility of the customer to ensure that the outlet is correctly wired and grounded to prevent an electrical shock.

Before installing or removing signal cables, ensure that the power cables for the system unit and all attached devices are unplugged.

When adding or removing any additional devices to or from the system, ensure that the power cables for those devices are unplugged before the signal cables are connected. If possible, disconnect all power cables from the existing system before you add a device.

Use one hand, when possible, to connect or disconnect signal cables to prevent a possible shock from touching two surfaces with different electrical potentials.

During an electrical storm, do not connect cables for display stations, printers, telephones, or station protectors for communication lines.
CAUTION:
This product is equipped with a three–wire power cable and plug for the user's safety. Use this power cable with a properly grounded electrical outlet to avoid electrical shock.

DANGER
To prevent electrical shock hazard, disconnect the power cable

Unit Emissions
The unit-related emission value is equal to or lower than 70dB(A).

Der Geräuschpegel der Einheit ist kleiner oder gleich 70 db(A).

Laser Safety Information
The optical drive in this system unit is a laser product. The optical drive has a label that identifies its classification. The label, located on the drive, is shown below.

CLASS 1 LASER PRODUCT
LASER KLASSE 1
LUOKAN 1 LASERLAITE
APPAREIL À LASER DE CLASSE 1
IEC 825:1984  CENELEC EN 60 825:1991

The optical drive in this system unit is certified in the U.S. to conform to the requirements of the Department of Health and Human Services 21 Code of Federal Regulations (DHHS 21 CFR) Subchapter J for Class 1 laser products. Elsewhere, the drive is certified to conform to the requirements of the International Electrotechnical Commission (IEC) 825 (1st edition 1984) and CENELEC EN 60 825:1991 for Class 1 laser products.

CAUTION:
A class 3 laser is contained in the device. Do not attempt to operate the drive while it is disassembled. Do not attempt to open the covers of the drive as it is not serviceable and is to be replaced as a unit.

Class 1 laser products are not considered to be hazardous. The optical drive contains internally a Class 3B gallium-arsenide laser that is nominally 30 milliwatts at 830 nanometers. The design incorporates a combination of enclosures, electronics, and redundant interlocks such that there is no exposure to laser radiation above a Class 1 level during normal operation, user maintenance, or servicing conditions.
Data Integrity and Verification

IBM computer systems contain mechanisms designed to reduce the possibility of undetected data corruption or loss. This risk, however, cannot be eliminated. Users who experience unplanned outages, system failures, power fluctuations or outages, or component failures must verify the accuracy of operations performed and data saved or transmitted by the system at or near the time of the outage or failure. In addition, users must establish procedures to ensure that there is independent data verification before relying on such data in sensitive or critical operations. Users should periodically check the IBM support websites for updated information and fixes applicable to the system and related software.
About This Book

This book provides information on how to use the system, use diagnostics, use service aids, and verify system operation. This book also provides information to help you solve some of the simpler problems that might occur.

ISO 9000

ISO 9000 registered quality systems were used in the development and manufacturing of this product.

Online Publications

RS/6000 publications are available online. To access the online books, visit our Web site at: http://www.rs6000.ibm.com/resource/hardware_docs/

Related Publications

The following publications provide additional information about your system unit:

- The RS/6000 44P Series Model 170 Installation Guide, order number SA38-0561, contains reference information, maintenance analysis procedures (MAPs), error codes, removal and replacement procedures, and a parts catalog.
- The RS/6000 44P Series Model 170 Service Guide, order number SA38-0560, contains reference information, maintenance analysis procedures (MAPs), error codes, removal and replacement procedures, and a parts catalog.
- The Diagnostic Information for Multiple Bus Systems, order number SA38-0509, contains diagnostic information, service request numbers (SRNs), and failing function codes (FFCs).
- The Adapter, Device, and Cable Information for Multiple Bus Systems, order number SA38-0516, contains information about adapters, devices, and cables for your system. This manual is intended to supplement the service information found in the Diagnostic Information for Multiple Bus Systems.
- The Site and Hardware Planning Guide, order number SA38-0508, contains information to help you plan your installation.

Trademarks

The following terms are trademarks of International Business Machines Corporation in the United States, other countries, or both:

- AIX

- RS/6000
- PowerPC
Other company, product, and service names may be trademarks or service marks of others.
Chapter 1. Introducing the 44P Model 170

The 7044 Model 170 servers combine PowerPC 604e microprocessor performance and system expandability, ensuring that your server adapts to handle ever-changing operating requirements. The 7044 Model 170 servers are specifically designed to support the demands of network environments.

The 7044 Model 170 servers incorporate the peripheral component interconnect (PCI) bus, which is faster than the industry standard architecture (ISA) bus.

This book helps you use the system, use diagnostics, use service aids, and verify system operation. This book also provides information to help you solve some of the simpler problems that might occur, and how to obtain assistance and service.

System Features

Bus Architecture
Six PCI slots are available:
- Two 64-bit PCI full-size slots at 50 MHz (can also run at 33MHz), 3.3 volts
- Four 32-bit PCI full-size slots at 33 MHz, 5 volts

Microprocessor
- One 333 MHz Power3+ microprocessor with 32KB instruction, 64KB data and 1MB L2 cache, OR
- One 400 MHz Power3+ microprocessor with 32KB instruction, 64KB data and 4MB L2 cache
- One 450 MHz Power3+ microprocessor with 32KB instruction, 64KB data and 8MB 4-way L2 cache

Memory
- 256 MB (minimum) - 2 GB (maximum).
  Up to four dual inline memory-modules, installed in pairs, to support 128MB, 256MB or 512MB (must be installed in matched pairs).

Media Drives
- 3.5-inch, 1.44 MB Diskette Drive (standard)
- Internal Hard Disk Drives:
  - 9.1 GB Ultra SCSI Drive (standard)
  - 18.2 GB Ultra SCSI Drive

  Note: Larger sizes may be available. Contact your representative for additional information.
- Two media bays available
• 32x speed CD-ROM drive with sliding tray.

Other Drives
Drive bays can accommodate 5.25-inch or 3.5-inch drives such as hard disk drives, CD-ROM drives, tape drives, or other removable media drives.

Power Supply
• 390-watt, usable with 100-127 V ac (low voltage) or 200-240 V ac (high voltage).

Keyboard
• Standard: 101-key Enhanced Keyboard
• 101/102 or 106-key Enhanced Keyboard

Mouse
• 3-button

Operator Panel
• 32-character LED diagnostics display
• Power and Reset buttons

Input/Output Ports
• 25-pin Parallel
• 9-pin Serial (2)
• 8-pin Tablet
• Keyboard
• Mouse
• Ultra2 SCSI - LVD
• 10Base5 Ethernet
• 10BaseT or 100BaseTX Ethernet
• Audio Line-in
• Audio Line-out
• Microphone
• Headphone

Security Features
• Power-on password
• Privileged-access password
• Security Bolt (optional)
• Key lock
• Unattended start mode
Front View

1 **Serial Number Label**: For machine identification.

2 and 3 **9-Pin Serial Ports (TTY modem)**: For a TTY terminal, modem, or other serial devices.

4 **Keylock**: For security.

5 **Security Bolt**: Optional security measure.

6 **Adapter Slots (6)**: For adding PCI adapters.

7 **Empty Slot**: This slot is not used.

8 **Ethernet Connector (Ethernet)**: For attaching your computer to an Ethernet/Twisted pair connection through a 10baseT connector.

9 **Headphones**: For connecting headphones.

10 **Microphone**: For connecting a microphone.
11 and 12 Audio Ports:

Audio line out
Audio line in

13 External SCSI Port ( ) : For connecting external SCSI devices.

14 Parallel Port ( ) : For connecting a parallel printer or other parallel devices.

15 Tablet Port ( ) : For attaching a digitizing tablet to your computer.

16 Mouse Port ( ) : For mouse connection.

17 Keyboard Port ( ) : For keyboard connection.

18 10Base5 Ethernet Port ( ) : For attaching your computer to an Ethernet thick connection (or Ethernet thin connection, using an optional transceiver) through a 10base5 connector.

19 Status Light: For indicating power supply status.

20 Power Connector: For connecting the power cable.
Operator Panel

1 Power On Switch: Turns system unit power on and off.

2 Reset Switch: Function depends upon the operating system.

3 Power-On LED: Glows when system unit is on.

4 Hard Disk Drive Status LED: Glows when system unit is reading from or writing to the disk drive.

5 Operator Panel Display: Displays current status of system unit startup, or diagnostic information in the event of a hardware problem.

6 Headphone Jack: For connecting audio headphones.

7 Microphone Receptacle: For connecting audio microphone.
Chapter 2. Using the 44P Series Model 170

This chapter provides information on how to start and use the system unit.

Starting the System Unit

1. Set the power switches of the attached devices to On.

   **Note:** When the system is plugged in but not powered on, the Power-On LED flashes slowly.

2. If the LED is not flashing and **OK** is not displayed, ensure that the power cord, located at the back of the system unit, is plugged into a grounded electrical outlet.

3. If this does not solve the problem, go to "Chapter 8. Hardware Problem Determination" on page 149.

4. Press the Power-On switch (1).

   ![Diagram of system unit controls]

   When you press the Power-On switch (1), the Power-On LED (2) comes on, and the system starts a POST (power-on self test).

   During POST, progress codes display in the operator panel display.

5. If the Power-On LED does not come on and there is no indication of power when you press the Power-On switch, go to "Chapter 8. Hardware Problem Determination" on page 149.

Stopping the System Unit

**Attention:** When you use the shutdown procedure for your system, follow the correct shutdown procedure before you stop the system unit. Failure to do so can result in the loss of data. The System unit is powered down by the shutdown procedure.

1. At a command line, enter `shutdown` command to stop the operating system.

2. After you shut down the operating system, set the power switches of any attached devices to Off.

3. If you will be servicing the system unit, unplug the system-unit power cable from the electrical outlet.
Reading the Operator Panel Display

The operator panel display is used to:
- Track the progress of the system unit self-tests and configuration program
- Display codes when the operating system comes to an abnormal end
- Display system messages

Operator Panel

1 **Power On Switch**: Turns system unit power on and off.

2 **Reset Switch**: Function depends upon the operating system.

3 **Power-On LED**: Glows when system unit is on.

4 **Hard Disk Drive Status LED**: Glows when system unit is reading from or writing to the disk drive.

5 **Operator Panel Display**: Displays current status of system unit startup, or diagnostic information in the event of a hardware problem.

6 **Headphone Jack**: For connecting audio headphones.

7 **Microphone Receptacle**: For connecting audio microphone.
Using the Keyboards

There are several keyboards available for the system unit. The keyboards have various keys that enter data and control the cursor location. The keyboards can be engraved for the languages of different countries.

The functions of each keyboard depend on the software used. The character sets for the keyboards are contained and explained in the documentation for your operating system.

The keyboard is divided into four sections:

- **Function keys** are multipurpose keys and their function is controlled by the operating system.
- **Typewriter keys** are similar to a standard typewriter. Their function is controlled by the software.
- **Control keys** move the cursor on the screen and do programmed control functions. The movement and functions depend upon the application used.
- **Numeric keypad** is arranged like a calculator to help when typing numbers.

On all of the keyboards, you can adjust the tilt position for typing comfort. To tilt the keyboard, pull out on the keyboard legs. The legs snap into position. To decrease the tilt of the keyboard, rotate the keyboard legs until they snap into the bottom of the keyboard case.

The keyboard cable plugs into the keyboard connector at the rear of the system unit.
Using the Three-Button Mouse

The mouse is a hand-operated locating device. A three-button mouse is available for use with the system unit. Consult your application publication for the exact use of the three-button mouse.

You can use the mouse to perform such functions as positioning a cursor, selecting items from a menu, or moving around in your document much easier and faster than if you used only the keyboard. The cursor moves exactly as you move the mouse on a flat surface, such as a desktop.

With the mouse buttons, you can perform functions such as selecting and deselecting options, extending your selection, or choosing a command. The precise function of your mouse depends on the software you are using.

The mouse has a cable that plugs into the mouse connector at the rear of the system unit.

Handling the Mouse Correctly

For best operation, handle the mouse with care. Incorrect handling can damage the mouse.

Do not:

- Operate the mouse on cloth, unfinished wood, newspaper, or carpet.
- Drop or hit the mouse.
- Carry the mouse by holding onto the cable.
- Expose the mouse to extreme temperatures or direct sunlight.
- Place the mouse in liquid spills.

Caring for the Mouse

The operating surface for the mouse should be smooth, clean, and flat. For example, you can operate the mouse on the following surfaces:

- Finished wood
- Glass
- Enamel
- Plastic
- Paper (except newspaper)
- Metal
Rough surfaces collect contaminants that can be transferred to the interior of the mouse by the ball.

Rough surfaces can also cause the pads located on the bottom of the mouse to prematurely wear. A deeply pitted surface could cause erratic operation of the mouse.

The surface you use should be free from spills, dirt, dust, lint, wax, eraser dust, and other foreign matter.

To care for the mouse:
- Inspect the work surface for spills or other contaminants.
- Dust the work surface.
- If you are using a paper pad, inspect it for wear and replace it if necessary.

**Cleaning the Mouse**

Use the following steps to clean the mouse:

1. Remove the retaining ring by turning it counterclockwise, in the direction of the arrow, as shown in the illustration.
2. Remove the ball.
3. Inspect the ball for contaminants. Wipe it clean with a dry, lint-free cloth.
4. If the ball is dirty, wash it in warm, soapy water. Rinse and wipe the ball with a lint-free cloth until dry.
5. Inspect the ball cavity in the mouse for foreign materials. If there are any foreign materials, remove them.
6. Replace the ball.
7. Replace the retaining ring on the mouse and align it with the open slots in the ball cavity.
8. Turn the retaining ring clockwise until the open slots are covered and you hear the ring snap into place.

Using the 3.5-Inch Diskette Drive

The system unit has a 1.44 MB diskette drive installed vertically in the front.

The 1.44 MB diskette drive can format, read, and write diskettes compatible with the following diskette drives:

- 1.0 MB diskettes with 720 KB formatted data capacity
- 2.0 MB diskettes with 1.44 MB formatted data capacity (HD)

Format the diskette according to its specified capacity.
Write-Protecting 3.5-Inch Diskettes

Write-protecting diskettes is necessary so that important information is not accidentally lost. When diskettes are write-protected, you can read information from the diskettes, but you cannot write information to them.

There is a write-protect tab on the 3.5-inch diskette. To locate the write-protect tab, turn the diskette over with the label facing down.

To prevent writing onto a diskette, slide the write-protect tab to open the protect slot, as shown in the illustration.

To allow writing onto a diskette, slide the write-protect tab to cover the protect slot, as shown in the illustration.
Loading and Unloading the 3.5-Inch Diskette

To load a diskette into the drive, insert the diskette in the diskette drive with the labeled metal shutter first. Push the diskette into the drive until you hear a click. The click indicates that the diskette is securely in position in the drive.

To unload the diskette, push the diskette-unload button. The diskette unloads partially from the drive. Remove the diskette.

Using the CD-ROM Drive

CAUTION:
A Class 1 laser is contained in the device. Do not attempt to operate the device while it is disassembled. Do not attempt to open the covers of the device, as it is not serviceable and is to be replaced as a unit.

This section describes the features of the 32X SCSI-2 CD-ROM Drive and provides instructions for handling the drive and CD-ROM discs. The CD-ROM is a half-high, 5.25", 8-bit, single-ended, tray-loading drive. Its features include the following:

- SCSI-2 interface supports both synchronous and asynchronous data transfer
- High-speed data transfer rate of 2100 KB per second (14X) at inner diameter and 4800 KB per second (32X) at outer diameter due to constant RPM spin rate
- High-speed synchronous burst rate of 10 MB per second
- Average random access time of 90 ms
- Loading tray accommodates both 8 cm discs (in the horizontal orientation only) and 12 cm discs
- Reads multi-session discs
- Reads CD-recordable discs
- Reads CD-RW discs
- Supports all major CD-ROM formats: Mode 1, Mode 2, XA, CDDA, and audio
- Contains headphone output and line output for audio
Front View of CD-ROM Drive

2 Emergency Eject Hole
3 Headphone Jack
4 Volume Control
5 Status Light
6 Load/Unload Button

Understanding the Status Lights

The status lights indicate the operational status of the drive. The various conditions are explained below.

<table>
<thead>
<tr>
<th>If light is:</th>
<th>Condition is:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>Drive is in standby mode with or without a disc loaded.</td>
</tr>
<tr>
<td>Blinking (green)</td>
<td>Any of the following:</td>
</tr>
<tr>
<td></td>
<td>• Drive tray is inserted. The light blinks while the drive completes the initialization checkout.</td>
</tr>
<tr>
<td></td>
<td>• Drive is reading data. The light blinks while data is being read.</td>
</tr>
<tr>
<td></td>
<td>• Drive is in Play Audio Mode. The light blinks while the audio is playing.</td>
</tr>
<tr>
<td>On (amber)</td>
<td>Hardware error condition found during initialization.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If this occurs, contact your service representative.</td>
</tr>
</tbody>
</table>
Handling Compact Discs

Compact discs are high-density media that must be handled with care and kept clean to ensure that they remain readable. Use the following precautions to ensure reliability:

- Hold the compact disc by the edges. Do not touch the surface of the compact disc.
- To remove dust or fingerprints, wipe the compact disc from the center to the outside of the compact disc as shown, using a lint-free cloth.

Attention: Wiping the compact disc in a circular direction can cause loss of data.

- Do not write on the surface.
- Do not store or place the compact disc in direct sunlight.
- Do not use benzene, thinners, or other cleaners to clean the compact disc.
- Do not bend the compact disc.

Other Handling Considerations

Be sure to take the following additional precautions when you use the 32X SCSI-2 CD-ROM Drive:

- Remove compact discs from the tray before you move the drive anywhere.
- Do not place the drive where any of the following conditions exist:
  - High temperature
  - High humidity
  - Excessive dust
  - Excessive vibration or sudden shock
  - Inclined surface
  - Direct sunlight
  - Do not insert foreign objects into the drive.
  - Do not remove the drive covers or attempt to service the drive yourself.
Loading a Compact Disc

To load a compact disc into the drive, do the following:

1. Press the Load/Unload button to open the tray. The tray slides out of the drive.
2. Place the compact disc in the tray with the label facing up.
3. Press the Load/Unload button, or gently push in the tray, to close the tray.

Note: Be sure that none of the vertical retaining tabs are extended when you use the drive in the horizontal position.
Opening the Tray Manually

The compact disc tray automatically opens when you press the Load/Unload button. If it does not automatically open, follow these steps to force it open manually:

1. Shut down and turn off the power to your system unit.
2. Insert the straightened end of a paper clip into the emergency eject hole until you feel some resistance. See "Front View of CD-ROM Drive" on page 15 if you are not sure where the emergency eject hole is located.
3. Continue to push in the paper clip while you pull out the tray with your fingernail.
4. Pull the tray completely open and remove the disc. It is normal for the tray to make a clicking sound while you are pulling it open.

Playing an Audio CD

To play an audio CD, you must have headphones connected to the headphone jack located on the front of the drive, or connected to the line-out connector located on the back of the system. You must also have an audio software application installed.

The headphone jack provides the connection for headphones using a 3.5 mm (1/8") stereo mini-plug. The volume control adjusts the audio output level for the headphones.

General Information for the 8mm Tape Drive

The 8mm Tape Drive is an internal streaming tape drive that provides medium to high-capacity backup and archival capability, as well as a high data-transfer rate. The 8mm Tape Drive uses wide bus architecture. Communications on the SCSI bus can be either asynchronous or synchronous. The 8mm Tape Drive is read only compatible with existing 2.3 GB, 5.0 GB, and 7.0 GB 8 mm tape drives. The 8mm Tape Drive is a boot device.

The tape drive is used primarily for:
• Saving and restoring system data files
• Archiving important records
• Distributing operating system software upgrades

The drive conforms to the American National Standards Institute (ANSI) SCSI-2 standard.

Features of the 8mm Tape Drive include:
• Use of 8 mm data cartridges.
• Compression capability, effectively doubling the native capacity and data rate. The actual capacity per cartridge varies depending on the application and the type of data cartridge being used.
**Note:** The factory default setting is *Activated*. Data compression is usually controlled by the application software.

- A half-high 5.25-inch form-factor.
- An LCD display that provides operating and error messages.
- Status lights that indicate:
  - When it is time to clean the tape drive
  - When the tape is in motion
  - When the drive is ready to accept tape motion commands

**Front View of the 8mm Tape Drive**

1. Disturbance (amber)
2. Ready (green)
3. Activity (green)
4. Status lights
5. LCD display
6. Tape drive door
7. Unload button
Operating Recommendations

Attention: Be sure to read “Handling Static-Sensitive Devices” in the RS/6000 44P Series Model 170 Installation Guide, order number SA38-0561, Installing and Removing devices chapter before you remove the 8mm Tape Drive from its anti static bag or any time you handle it. For optimum performance, always follow the recommendations listed below:

- Handle the drive carefully and by its external metal chassis. Keep your hands away from the printed circuit boards, components, and printed circuit (flex) cables.
- If possible, work on a cushioned surface, and do not drop the tape drive onto the work surface.
- If you move the tape drive to an environment that is colder or warmer than its previous environment, keep the drive in its package and allow the package to reach the current room temperature. This prevents potential data loss or damage to the tape drive. Allow one hour of acclimation for each 10 degrees C (18 degrees F) difference between the shipping and/or storage temperature and the room temperature.
- Use only high-quality data grade 8 mm tape cartridges recommended by the manufacturer (see “Obtaining Additional Tape Cartridges” on page 29).
- Remove the tape cartridge from the tape drive when it is not in use, and store the cartridge in the cartridge case.
- Do not open the door on the data tape cartridge. This door covers and protects the magnetic tape material from dirt, dust, and damage.
- Avoid touching the tape, as doing so can cause loss of data.
- Back up any tape cartridge that repeatedly produces error messages, then discard the old tape cartridge. Error information is saved in the system error log.
- Clean the tape path regularly according to the cleaning procedure described in “Cleaning the Tape Drive” on page 27. Use only recommended cleaning cartridges. Other cleaning cartridges can permanently damage the tape drive.

8 mm Tape Cartridge Types
There are different types of 8 mm tape cartridges that you can use for the following purposes:

<table>
<thead>
<tr>
<th>Type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Tape Cartridge</td>
<td>Checks the operation of the drive or to run diagnostics. Do not use it to save programs or data. This cartridge, which is specially labeled, is included with the 8mm Tape Drive.</td>
</tr>
<tr>
<td>Data Tape Cartridge</td>
<td>Saves your programs or data. This cartridge is included with the 8mm Tape Drive.</td>
</tr>
<tr>
<td>Cleaning Tape Cartridge</td>
<td>Cleans the 8 mm tape drive. See “Cleaning the Tape Drive” on page 27. This cartridge is included with the 8mm Tape Drive.</td>
</tr>
</tbody>
</table>
Tape Cartridge Compatibility

The 8mm Tape Drive is compatible with existing 8 mm tape subsystems that comply to the American National Standard (ANSI) X3B5–89-136, Rev. 6, Helical-scan Digital Computer Tape Cartridge, 8 mm for Information Exchange. Refer to the following table for information about specific tape compatibility.

<table>
<thead>
<tr>
<th>Format Modes (C=compression mode)</th>
<th>8mm Tape Drive</th>
<th>2.3 GB</th>
<th>2.3 GB (C)</th>
<th>5.0 GB</th>
<th>5.0 GB (C)</th>

Setting the Write-Protect Tab on 8 mm Tape Cartridges

Set the write-protect tab on a tape cartridge so that you do not accidentally lose information. The window on the tape cartridge controls write-protection. When the window on a tape cartridge is closed, write-protection is set and information can be read from the tape, but not written to it. When the window on a tape cartridge is open, write-protection is not set and information can be read from the tape and written to it.

1. Window open: Write-protect tab not set
2. Window closed: Write-protect tab set
Environmental Considerations for 8 mm Data Cartridges

This section describes operating and storage conditions including temperature, relative humidity, and maximum wet bulb data.

Attention: The manufacturer specifies a set of temperature and humidity ranges in which the 8 mm data cartridge can operate with ease. Only regular cleaning procedures are required when operating the cartridge within this range. The risk of possible data loss is increased if 8 mm tape cartridges are operated, stored, or shipped outside the temperature or humidity ranges shown in the following table.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Operating Ranges</th>
<th>Storage</th>
<th>Shipping</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature</td>
<td>60°F-90°F (16°C-32°C)</td>
<td>41°F-90°F (5°C-32°C)</td>
<td>-40°F-126°F (−40°C-52°C)</td>
</tr>
<tr>
<td>Relative Humidity</td>
<td>20%-80%</td>
<td>20%-80%</td>
<td>20%-80%</td>
</tr>
<tr>
<td>(non-condensing)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Maximum Wet Bulb</td>
<td>73°F (23°C)</td>
<td>79°F (26°C)</td>
<td>79°F (26°C)</td>
</tr>
</tbody>
</table>

Always let a cartridge acclimate to the operating environment before you use it. Acclimation is necessary for any data cartridge that has been exposed to a different humidity environment or to a temperature change of 11°C or 20°F or more. Place the cartridge, with its container, in the operating environment for as long as it has been away from the operating environment or for 24 hours, whichever is less.

Operating the 8mm Tape Drive in Harsh Environments

The 8mm Tape Drive is ideally suited to streaming operations rather than tape movement operations involving multiple stops and starts as well as random searches. You should use streaming movement whenever possible.

Do not use for archiving any tape that was previously used outside the ranges specified in Environmental Considerations for 8 mm Data Cartridges for an extended period of time. Exposure to the new environment deteriorates the magnetic and physical strength of the tape. Do not store important data on a tape that was used outside the specified ranges. For reliable archiving, transfer the data to a new tape.

Erasing 8 mm Data Cartridge

Most bulk eraser devices cannot erase 8 mm data cartridges. To properly erase an 8 mm data cartridge with a bulk eraser device, the erasure rating must be at least 1500 oersted.
Using the 8mm Tape Drive

This section provides information about operating, using, and maintaining your 8mm Tape Drive.

Status Lights

The 8mm Tape Drive has two green status lights and one amber status light. The on and off combinations of the status lights indicate the current condition of the tape drive.

Each of the International Organization for Standards (IOS) symbols located next to a status light indicates a specific condition of the tape drive as follows:

1. Disturbance (amber)
2. Ready (green)
3. Activity (green)
4. Status lights
Status Disturbance Ready (green) Activity (green)
The power-on self-test (POST) is running or the system has issued a Reset to the drive. On On On
One of the following has occurred:
• The power is off.
• The POST has completed successfully, but no tape cartridge has been inserted.
See note 2 Off/On Off Off
A tape cartridge has been inserted, and the 8mm Tape Drive is ready to receive commands from the system. See note 2 Off/On On Off
A tape cartridge has been inserted, and the 8mm Tape Drive is performing a tape load or unload operation. See note 2 Off/On Off Flashing
The tape is in motion, and the 8mm Tape Drive is busy running a device operation. See note 2 Off/On On Flashing
The 8mm Tape Drive has detected an internal fault that requires corrective action. See note 2 Flashing Off Off
The tape path requires cleaning. Refer to "Cleaning the Tape Drive" on page 27. On Off or On Off or Flashing

Notes:
1. If a fault or an error condition occurs, press the unload button for approximately 15 seconds to reset the drive. If the disturbance light still flashes after the reset, contact your service representative for assistance.
2. If the disturbance light is on, cleaning is required. See "Cleaning the Tape Drive" on page 27.

Liquid Crystal Display
The 8mm Tape Drive features a liquid crystal display (LCD), which is located on the front panel. The LCD displays operating and error messages.

Changing the Display Language
The text on the 8mm Tape Drive LCD is available in several languages. To change the language:
1. Press and hold the unload button after you turn the power on to the 8mm Tape Drive or, if your system unit is already running, press and hold the unload button for approximately 15 seconds until the LCD displays RESET. Release the unload button for approximately one second, then press and hold the unload button again.
2. After the LCD cycles through all the reset messages, it cycles through the available languages. When the desired language displays, release the unload button.
Loading the 8 mm Tape Cartridge

Before loading the tape cartridge, make sure the system unit power is on and that the write-protect tab on the tape cartridge is properly set. Refer to “Setting the Write-Protect Tab on 8 mm Tape Cartridges” on page 21. The tape drive loads the tape from the cartridge and prepares it for reading and writing.

1. Grasp the edges of the 8 mm tape cartridge with the write-protect tab toward you and the window side of the cartridge facing up.

2. Slide the tape cartridge into the opening on the front of the 8 mm tape drive until the loading mechanism pulls the cartridge into the drive and the drive door closes.

The ready status light (green) comes on if the load operation was successful.

The service processor is ready for data operations when the tape cartridge is inserted. After the cartridge is inserted into the tape drive, the tape takes about 25 seconds to load.

Commands can be entered while the tape is loading. Any commands to the tape drive start running once the tape has finished loading. Commands not requiring the tape cartridge are run immediately.
Unloading the 8 mm Tape Cartridge

Before you perform the unload operation, make sure the power to the system unit is on.

To unload and eject the tape cartridge, press the unload button. The service processor rewinds the tape, then ejects the tape cartridge from the tape drive. After you press the unload button, the following actions occur:

- The ready status light goes off.
- The read/write status light flashes during the unload operation.
- The read/write status light goes off when the cartridge is ejected from the tape drive.

The time required for a tape to rewind and unload is between 18 seconds and 3 minutes, depending on the position of the tape when you push the unload button.

If a fault or an error condition occurs and you cannot eject the tape, press the unload button for approximately 15 seconds to reset the drive. If the tape cartridge cannot unload and has to be removed manually from the drive, contact your service representative.

1. Window side of tape cartridge
2. 8 mm tape cartridge
3. Write-protect tab
4. Unload button
Cleaning the Tape Drive

Attention: Do not use video-cleaning cartridges in the 8mm Tape Drive. Video-cleaning cartridges can damage the system drive.

Clean the tape drive:
• After you use a metal particle (MP) tape and before you use an advanced metal evaporative (AME) tape
• When error rates exceed an acceptable level as indicated by the LED and message
• Every 72 hours of tape motion as indicated by the LED and message

The 8mm Tape Drive counts the number of hours of tape motion. When it is time to clean the tape path, it displays the message **CLEAN SOON** and turns on the top status light.

You must clean the tape after using metal particle (MP) media and before using advanced metal evaporative (AME) tapes. If you use MP media, the LCD prompts you to clean the tape path by displaying the message MUST CLEAN.

More frequent cleaning may be required if you operate the drive in a dusty environment or in humid conditions. If you allow dust to accumulate, the drive has to perform more reads and writes. This can damage the drive or cause data loss, which can be prevented by regular cleaning.

The cleaning cartridge cleans the 8mm Tape Drive 18 times before you must discard it. If you attempt to use an 8 mm cleaning cartridge more than 18 times, the tape drive automatically detects the error, ejects the cleaning cartridge with the amber disturbance status light remaining on, and displays the message DEPLETED.
Before you load the cleaning cartridge, make sure the power to the tape drive is on.

1. Grasp the edges of the 8 mm cleaning cartridge with the window side of the cartridge facing up. Slide the cartridge into the opening on the front of the 8mm Tape Drive until the loading mechanism pulls it into the drive.

2. After you fully insert the 8 mm cleaning cartridge into the 8mm Tape Drive, the following cleaning operations are automatically performed:
   - The cleaning tape loads into the tape path. The message CLEANING... displays. The cleaning cycles take approximately two minutes.
   - The tape unloads and the cleaning cartridge ejects from the tape drive upon completion of the cleaning operation.
   - The amber disturbance status light goes off if the cleaning operation was successful.

3. Record the use of the cleaning cartridge on the cartridge.
Obtaining Additional Tape Cartridges

Use only tape cartridges recommended by the manufacturer in the 8mm Tape Drive. Contact your customer service representative or the place of purchase to obtain the recommended tape cartridges.

General information for the 12/24GB 4mm Tape Drive

The 12/24GB 4mm Tape Drive is an internal streaming tape drive that provides medium to high-capacity backup and archival capability as well as high data transfer rate. The 12/24GB 4mm Tape Drive uses NARROW bus (8-bit) architecture. Communications on the SCSI bus can be either asynchronous or synchronous. The 12/24GB 4mm Tape Drive is compatible with existing 2.0 GB and 4.0 GB 4 mm tape drives. The 12/24GB 4mm Tape Drive can be used as a boot device.

The tape drive is used primarily for:
• Saving and restoring system data files
• Archiving important records
• Distributing operating system software upgrades.

The drive conforms to the American National Standards Institute (ANSI) SCSI-2 standard.

The 12/24GB 4mm Tape Drive’s features include:
• Use of 12/24 GB 4 mm data cartridges.
• Data rate of 1.1 MB/second.
• Capacity of 12 GB.
• Compression capability, which effectively doubles the native capacity of 12 GB and the effective data rate. The actual capacity per cartridge varies depending on the application and the type of data cartridge being used. The default is compressed. Use SMIT to change the default.

Note: The factory default setting is Activated. Data compression is usually controlled by the application software.
• A half-high 5.25-inch form-factor.
• Status lights that indicate:
  – When it is time to clean the tape drive
  – When the tape is in motion
  – When the drive is ready to accept tape motion commands.
Using the 12/24GB 4mm Tape Drive

This chapter provides information about operating, using, and maintaining your 12/24GB 4mm Tape Drive.

Operating Recommendations

Attention: For optimum performance, always follow the recommendations listed below:

- Use only high-quality data grade 12/24 GB 4 mm tape cartridges recommended by the manufacturer (see "Obtaining Additional Tape Cartridges" on page 38). Tape cartridges that do not carry the proper DDS symbol cannot be written to, and their use causes the 12/24GB 4mm Tape Drive to report an error.
- Remove the tape cartridge from the tape drive when it is not in use, and store the cartridge in the cartridge case.
- Do not open the door on the data tape cartridge. This door covers and protects the magnetic tape material from dirt, dust, and damage.
- Avoid touching the tape, as doing so can cause loss of data.
- Back up any tape cartridge that repeatedly produces error messages, then discard the old tape cartridge. Error information is saved in the system error log.
- Clean the tape path regularly according to the cleaning procedure described in "Cleaning the Tape Path on the 12/24GB 4mm Tape Drive" on page 37. Use only recommended cleaning cartridges. Other cleaning cartridges can permanently damage the tape drive.
12/24 GB 4 mm Tape Cartridge Types

There are different types of 12/24 GB 4 mm tape cartridges that you can use for the following purposes:

<table>
<thead>
<tr>
<th>Type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Tape Cartridge</td>
<td>Checks the operation of the drive or to run diagnostics. Do not use it to save programs or data. This cartridge, which is specially labeled, is included with the 12/24GB 4mm Tape Drive.</td>
</tr>
<tr>
<td>Data Tape Cartridge</td>
<td>Saves your programs or data. This cartridge is included with the 12/24GB 4mm Tape Drive.</td>
</tr>
<tr>
<td>Cleaning Tape Cartridge</td>
<td>Cleans the 12/24GB 4mm Tape Drive. See &quot;Cleaning the Tape Path on the 12/24GB 4mm Tape Drive&quot; on page 37. This cartridge is included with the 12/24GB 4mm Tape Drive.</td>
</tr>
</tbody>
</table>

Tape Cartridge Compatibility

The tape drive is compatible with existing 12/24 GB 4 mm tape subsystems that are designed to operate with Digital Data Storage approved media (DDS-1, DDS|||, DDS-2, or DDS-3), which meet the following European Computer Manufacturers Association (ECMA) standards:

- ECMA–139 “3.81 Wide Magnetic Tape Cartridge for Information Interchange” – Helical Scan Recording – DDS Format.
- ECMA–139 “3.81 Wide Magnetic Tape Cartridge for Information Interchange” – Helical Scan Recording – DDS–2 Format.
- ECMA–139 “3.81 Wide Magnetic Tape Cartridge for Information Interchange” – Helical Scan Recording – DDS–3 Format.

4 mm Tape Write Density Setting

When reading a tape, the drive automatically determines which format is written on the tape.

When writing to a tape, use SMIT (System Management Interface Tool) to change the density setting of the tape drive to correspond to the type of media installed. Refer to the following table for information about the specific density setting:

<table>
<thead>
<tr>
<th>Media Type</th>
<th>Device Compatibility</th>
<th>SMIT Density Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>DDS1</td>
<td>Read Only</td>
<td>N/A</td>
</tr>
<tr>
<td>DDS</td>
<td></td>
<td></td>
</tr>
<tr>
<td>DDS2</td>
<td>Read / Write (4.0 GB Mode Only)</td>
<td>36</td>
</tr>
<tr>
<td>DDS3</td>
<td>Read / Write (12.0 GB Mode Only)</td>
<td>37</td>
</tr>
</tbody>
</table>
Setting the Write-Protect Tab on 12/24 GB 4 mm Tape Cartridges

Set the write-protect tab on a tape cartridge so that you do not accidentally lose information. The write-protect tab on the tape cartridge controls write-protection. When the write-protect tab on a tape cartridge is closed, information can be read from the tape and written to it. When the write-protect tab on a tape cartridge is open, information can be read from the tape, but not written to it.

1  Write-protect tab closed: Write enabled
2  Write-protect tab open: Write disabled

Erasing 12/24 GB 4 mm Data Cartridge

Most bulk eraser devices cannot erase 12/24 GB 4 mm data cartridges. To properly erase an 12/24 GB 4 mm data cartridge with a bulk eraser device, the erasure rating must be at least 3900 oersted.

Environmental Considerations for 12/24 GB 4 mm Data Cartridges

This section describes operating and storage conditions including temperature, relative humidity, and maximum wet bulb data.

Attention: The manufacturer specifies a set of temperature and humidity ranges in which the 12/24 GB 4 mm data cartridge can operate with ease. Only regular cleaning procedures are required when operating the cartridge within this range. The risk of possible data loss is increased if 12/24 GB 4 mm tape cartridges are operated, stored, or shipped outside the temperature or humidity ranges shown in the following table.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Operating Ranges</th>
<th>Storage</th>
<th>Shipping</th>
</tr>
</thead>
<tbody>
<tr>
<td>Temperature</td>
<td>60°F-90°F (16°C-32°C)</td>
<td>41°F-90°F (5°C-32°C)</td>
<td>-40°F-126°F (-40°C-52°C)</td>
</tr>
<tr>
<td>Relative Humidity</td>
<td>20%-80%</td>
<td>20%-80%</td>
<td>20%-80%</td>
</tr>
<tr>
<td>(non-condensing)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Maximum Wet Bulb</td>
<td>79°F (26°C)</td>
<td>79°F (26°C)</td>
<td>79°F (26°C)</td>
</tr>
</tbody>
</table>
Always let a cartridge acclimate to the operating environment before you use it. Acclimation is necessary for any data cartridge that has been exposed to a different humidity environment or to a temperature change of 11°C (20°F) or more. Place the cartridge, with its container, in the operating environment for as long as it has been away from the operating environment or for 24 hours, whichever is less.

Operating the 12/24GB 4mm Tape Drive in Harsh Environments

The tape drive is ideally suited to streaming operations rather than tape movement operations involving multiple stops and starts and random searches. You should use streaming movement whenever possible.

Do not use for archiving any tape that was previously used outside the ranges specified in Environmental Considerations for 12/24 GB 4 mm Data Cartridges on page 32 for an extended period of time. Exposure to the new environment deteriorates the magnetic and physical strength of the tape. Do not store important data on a tape that was used outside the specified ranges. For reliable archiving, transfer the data to a new tape.

Status Lights

The 12/24GB 4mm Tape Drive has two green status lights and one amber status light. The on and off combinations of the status lights indicate the conditions of the 12/24GB 4mm Tape Drive.

Each of the International Organization for Standards (ISO) symbols located above a status light indicates a specific condition of the tape drive as follows:

1. Tape Drive Door
2. Status lights
3. Ready (green)
4. Tape Motion (green)
5. Disturbance (amber)
6. Unload/Reset button
**Status Light States**

The following tables explain the meaning of the green and amber status lights.

<table>
<thead>
<tr>
<th>Status</th>
<th>Ready (green)</th>
<th>Tape Motion (green)</th>
<th>Disturbance (amber)</th>

<td>On</td>
</tr>
</tbody>
</table>

**Notes:**

1. If a fault or an error condition occurs, press the unload button for approximately 15 seconds to reset the drive. If the disturbance light still flashes after the reset, contact your service representative for assistance.

2. If the disturbance light is on, cleaning is required. See [Cleaning the Tape Path on the 12/24GB 4mm Tape Drive](#) on page 37.
Loading the 12/24 GB 4 mm Tape Cartridge

Before you load the tape cartridge, make sure the power is on and the write-protect tab on the tape cartridge is properly set. Refer to "Setting the Write-Protect Tab on 12/24 GB 4 mm Tape Cartridges" on page 32. The tape drive loads the tape from the cartridge and prepares it for reading and writing.

To load the 12/24 GB 4 mm tape cartridge, do the following:

1. Grasp the edges of the 12/24 GB 4 mm tape cartridge with the write-protect tab towards you and the window side of the cartridge facing up.

2. Slide the tape cartridge into the opening on the front of the 12/24 GB 4 mm tape drive until the loading mechanism pulls the cartridge into the drive and the drive door closes. The ready status light (green) goes on if the load operation was successful.

The 12/24GB 4mm Tape Drive is ready for data operations when the tape cartridge is inserted. After the cartridge is inserted into the tape drive, the tape takes about 15 seconds to load.
Unloading the 12/24 GB 4 mm Tape Cartridge

Before performing the unload operation, make sure the power to the system unit is on.

To unload and eject the tape cartridge, press the unload button. The 12/24GB 4mm Tape Drive rewinds the tape and then ejects the tape cartridge from the tape drive.

After you press the unload button, the following occurs:
1. The Ready status light turns off.
2. The Tape Motion status light flashes during the unload operation.
3. The Tape Motion status light turns off when the cartridge is ejected from the tape drive.

The time required for a tape to rewind and unload is between 10 seconds and 1.5 minutes, depending on the position of the tape when the unload button is pushed.

If a fault or an error condition occurs and you cannot eject the tape, press the unload button for approximately 15 seconds to reset the drive.

If the tape cartridge cannot unload and has to be removed manually from the drive, contact your service representative.
Cleaning the Tape Path on the 12/24GB 4mm Tape Drive

The 12/24 GB 4 mm tape path should be cleaned either approximately every 30 hours of tape motion or once a month, whichever occurs first. The 12/24 GB 4 mm tape drive monitors the recording quality of the tape cartridge and indicates that the tape path requires cleaning when the disturbance status light (amber) is on.

More frequent cleaning may be required if the drive is operated in a dusty environment or in humid conditions. If the dust is allowed to accumulate, the drive has to perform more reads and writes. This can cause data loss, and can be prevented by regularly scheduled cleaning of the drive. The amber Disturbance status light also comes on automatically after 30 hours of tape motion without cleaning.

If you attempt to use a 12/24 GB 4 mm cleaning cartridge beyond 20 cleanings, the tape drive automatically detects an error and ejects the cleaning cartridge with the disturbance status light (amber) remaining on.

Before you load the cleaning cartridge, make sure the power to the system unit is on.

To load the 12/24 GB 4 mm cleaning cartridge, do the following:
1. Grasp the edges of the 12/24 GB 4 mm cleaning cartridge with the window side of the cartridge facing up.
2. Slide the cleaning cartridge into the opening on the front of the 12/24 GB 4 mm tape drive until the loading mechanism pulls the cartridge into the drive.

After the 12/24 GB 4 mm cleaning cartridge has been fully inserted into the 12/24GB 4mm Tape Drive, the following cleaning operations are performed automatically:
1. The cleaning tape is loaded into the tape path. The cleaning cycle lasts approximately 30 seconds.
2. The tape is unloaded and the cleaning cartridge is ejected from the tape drive when the cleaning operation is complete.
3. A successful cleaning operation is indicated when the disturbance status light (amber) goes off (if it was activated before the cleaning operation).

Obtaining Additional Tape Cartridges
The following table lists the tape cartridges that you can order for the 12/24GB 4mm Tape Drive. Contact your customer service representative or the place of purchase to obtain the recommended tape cartridges.

<table>

Using the Service Processor and Service Director Features
The Service Processor and Service Director features protect users against unnecessary system downtime by keeping support personnel (both internal and external) aware of any unexpected changes in the system environment. In combination, the two features provide a flexible solution to automated system maintenance.

Service Processor
The Service Processor runs on its own power boundary and continually monitors hardware attributes, the AIX Operating System, and the environmental conditions within the system. Any system failure which prevents the system from coming back to an operational state (a fully functional AIX Operating System) is reported by the Service Processor. The Service Processor is controlled by firmware and does not require the AIX Operating System to be operational to perform its tasks. If any system failures are detected, the Service Processor has the ability to take predetermined corrective actions. The methods of corrective actions are:
- Surveillance
- Call Home
- AIX Operating System Monitoring

Surveillance is a function in which the Service Processor monitors the system through heartbeat communication with the system firmware. The heartbeat is a periodic signal that the firmware can monitor. During system startup, the firmware surveillance monitor is automatically enabled to check for heartbeats from the firmware. If a heartbeat is not detected within a default period, the Service Processor cycles the system power and attempts to restart until the system either restarts successfully, or a predetermined retry threshold is reached. In the event the Service Processor is unsuccessful in bringing the system online (or in the event that the user asked to be alerted to any Service Processor assisted restarts), the system can call home to report the error.
The Call Home function can be initialized to call either a service center telephone number, a customer administration center, or a digital pager telephone number. The Service Processor can be configured to stop at the first successful call to any of the numbers listed, or can be configured to call every number provided. If connected to the service center, the Service Processor transmits the relevant system information (the system’s serial number and model type) and Service Request Number (SRN). If connected to a digital pager service, the Service Processor inputs a Customer Voice Telephone Number defined by the customer. An established sequence of digits or the telephone number to a phone near the failed system could be used to signal a system administrator to a potential system failure.

During normal operations, the Service Processor can also be configured to monitor the AIX Operating System. If AIX does not respond to the Service Processor heartbeat, the Service Processor assumes the Operating System is hung. The Service Processor can automatically initiate a restart and, if enabled, initiate the call home function to alert the appropriate parties to the system hang. Enabling Operating System Surveillance also affords AIX the means to detect any Service Processor failures and report those failures to the Service Director application.

Unlike the Service Director, the Service Processor cannot be configured in a client/server environment where one system can be used to manage all dial-out functionally for a set of systems.

Prior to installing the Service Processor feature, ensure that you have the latest levels of Service Processor microcode and system firmware. You also need a properly configured modem. For more information on configuring a modem, see "Modem Configuration Menu" on page 54.

**Service Director**

The Service Director is a software extension to the AIX Operating System that monitors the system while the AIX Operating System is running. The Service Director monitors and analyzes all recoverable system failures, and, if needed, can automatically place a service call to a service center (without user intervention).

The service center receives the machine type/serial number, host name, SRN, and a problem description. The service center analyzes the problem report and, if warranted, dispatches a service person to the customer site. The service center also determines if any hardware components need to be ordered prior to the service person’s arrival.

The Service Director code also gives the user the option to establish a single system as the problem reporting server. A single system, accessible over the user network, can be used as the central server for all the other systems on the Local Area Network (LAN) who are running the Service Director application. If the Service Director application on a remote client decides a service request needs to be placed, the client forwards the information to the Service Director server who dials the service center telephone number from its locally attached modem. In this scenario, the user only needs to maintain a single analog line for providing call-out capabilities for a large set of servers.
When used in a Scalable Parallel (SP) environment, a client/server type implementation is configured. The Service Director client code runs on each of the Scalable Parallel (SP) nodes. The server component runs on the Control Workstation. In the event of any system failures, the relevant information is transmitted to the Control Workstation through the integrated Ethernet. Once alerted to the system failure, the Control Workstation initiates actions to prepare and send the service request.

A modem is required for enabling automated problem reporting to the service center. Configuration files for several types of modems are included as part of the Service Director package. Refer to "Modem Configuration Menu" on page 54 for more information on configuring your modem.
Chapter 3. Using the Service Processor

The service processor menus enable you to configure service processor options and to enable and disable functions.

Service processor menus are available using an ASCII terminal when the server is turned off and the service processor is operating with standby power. Service processor menus are also available when server power is on and the service processor has detected a server problem (such as loss of surveillance).

During the first power-up (that is, the power cord is plugged into the outlet), service processor menus are not available for 45 seconds while the service processor is running self-tests and initializing the server. If the server powers down, service processor menus become available after 15 seconds.

For a summary of the service processor functions and the methods for invoking them, see the table below.

<table>

3 General-Access password

---

### Service Processor Menus

The service processor menus are divided into two groups:
- General user menus - the user must know the general-access password.
- Privileged user menus - the user must know the privileged-access password.

The following section describes these two groups of menus, how to access them, and the functions associated with each option.

When the server is powered down, the service processor menus can be accessed locally or remotely.

### Service Processor Menu Inactivity

To prevent loss of control in unstable power environments, the service processor leaves the menu mode after five minutes of inactivity. Return to the menus by pressing any key on the terminal, local or remote.

### Accessing Service Processor Menus Locally

Service Processor menus can be accessed locally by connecting an ASCII terminal to either serial port. Because the presence of the ASCII terminal cannot be confirmed by the service processor, you must press a key on the ASCII terminal to confirm its presence. The service processor then prompts you for a password (if set), and when verified, displays the service processor menus.

### Accessing Service Processor Menus Remotely

Service Processor menus can be accessed remotely by connecting a modem to serial port 1 or serial port 2, as follows:
1. Turn off the server, unplug the power cord, and press the Power button to drain capacitance while power is disconnected.
2. Connect the modem to the appropriate serial port and turn on the modem.
3. Plug in the server.

**Note:**
If your modem has not been configured, go to "Call-In/Call-Out Setup Menu" on page 54 with a terminal or terminal emulator, call the server’s modem.

The service processor prompts you for a password (if set), and when verified, displays the service processor menus.

General User Menu

The menu options presented to the general user are a subset of the options available to the privileged user. The user must know the General-Access password, if set, to access these menus.

GENERAL USER MENU

1. Power-On System
2. Read VPD Image from Last System Boot
3. Read Progress Indicators from Last System Boot
4. Read Service Processor Error Logs
5. Read System POST Errors
6. View System Environmental Conditions
99. Exit from Menus

Note: The service processor prompt reads either 1> or 2> to indicate which serial port on the system unit is being used to communicate with the service processor.

- **Power-On System**
  Allows the user to power-on the system.

- **Read VPD Image from last System Boot**
  Displays manufacturer vial product data, such as serial numbers, part numbers, and so on, that were stored from the system boot prior to the one in progress now.

- **Read Progress Indicators from Last System Boot**
  Displays the boot progress indicators (checkpoints), up to a maximum of 100, from the system boot prior to the one in progress. This historical information can be useful to help diagnose system faults.

  The progress indicators are displayed in two sections. Above the dashed line are the progress indicators (latest) from the boot that produced the current sessions. Below the dashed line are progress indicators (oldest) from the boot preceding the one that produced the current sessions.

  The progress indicator codes are listed from top (latest) to bottom (oldest). The dashed line represents the point where the latest boot started.

  If the <-- arrow occurs, use the posted code.

- **Read Service Processor Error Logs**
  Displays the service processor error logs.

  The time stamp in this error log is Coordinated Universal Time (CUT), also known as Greenwich Mean Time (GMT). AIX error logs have additional information available and are able to time stamp the errors with local time. See page 68 for an example of the error log.
The following menus are available to privileged users only. The user must know the privileged access password, if set, to access these menus.

Main Menu

At the top of the Main Menu is a listing containing:

- Your Service Processor’s current firmware version
- The firmware copyright notice
- The System Name given to your server during setup (optional)

You need the firmware version for reference when you either update or repair the functions of your service processor.

The System Name, an optional field, is the name that your server reports in problem messages. This name helps your support team (for example, your system administrator, network administrator, or service representative) to more quickly identify the location, configuration, and history of your server. The System Name is set from the Main Menu using option 6.

Note: The information under the Service Processor Firmware heading in the following Main Menu illustration is example information only.
Service Processor Setup Menu

The Service Processor Setup menu shown below is accessed from the Main Menu:

```
SERVICE PROCESSOR SETUP MENU
1. Change Privileged Access Password
2. Change General-Access Password
3. Enable/Disable Console Mirroring: Currently Disabled
4. Start Talk Mode
5. OS Surveillance Setup Menu
6. Reset Service Processor
7. Reprogram Service Processor Flash EPROM
8. Serial Port Snoop Setup Menu
98. Return to Previous Menu
99. Exit from Menus
```

Note: Unless otherwise stated in the menu responses, settings become effective when a menu is exited using option 98 or 99.

Passwords

Passwords can be any combination of up to eight alphanumeric characters. You can enter longer passwords, but the entries are truncated to include only the first eight characters. Passwords can be set from the service processor menu or from the System Management Services menus.

For security purposes, the service processor counts the number of attempts to enter correct passwords. The results of not recognizing a correct password within this error threshold are different, depending on whether the attempts are being made locally (at the server) or remotely (through a modem). The error threshold is three attempts.

If the error threshold is reached by someone entering passwords at the server, the service processor exits the menus. This action is taken based on the assumption that
the server is in an adequately secure location with only authorized users having access. Such users must still successfully enter a login password to access AIX.

If the error threshold is reached by someone entering passwords remotely, the service processor disconnects the modem to prevent potential security attacks on the server by unauthorized remote users.

The following table illustrates what you can access with the Privileged Access Password and the General-Access Password.

<table>
<thead>
<tr>
<th>Privileged Access Password</th>
<th>General Access Password</th>
<th>Resulting Menu</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>None</td>
<td>MAIN MENU displays</td>
</tr>
<tr>
<td>None</td>
<td>Set</td>
<td>MAIN MENU displays</td>
</tr>
<tr>
<td>Set</td>
<td>None</td>
<td>Users with password, see the MAIN MENU displays. Other users, the GENERAL USER MENU displays.</td>
</tr>
<tr>
<td>Set</td>
<td>Set</td>
<td>Users see menus associated with the entered password</td>
</tr>
</tbody>
</table>

- **Change Privileged Access Password**
  Set or change the privileged access password. It provides the user with the capability to access all service processor functions. This password is usually used by the system administrator or root user.

- **Change General-Access Password**
  Set or change the general-access password. It provides limited access to service processor menus and is usually available to all users who are allowed to power on the server.

- **Enable/Disable Console Mirroring**
  When Console Mirroring is enabled, the service processor sends information to both serial ports. This capability, which can be enabled by local or remote users, provides local users with the capability to monitor remote sessions. Console mirroring can be enabled for the current session only. For more information, see [Console Mirroring](#) on page 67.

- **Start Talk Mode**
  In a console-mirroring session, it is useful for those who are monitoring the session to be able to communicate with each other. Selecting this menu item activates the keyboards and displays for such communications while console mirroring is established. This is a full duplex link, so message interference is possible. Alternating messages between users works best.

- **OS Surveillance Setup Menu**
  This menu can be used to set up operating system (OS) surveillance.
**OS Surveillance Setup Menu**

1. Surveillance: Currently Enabled
2. Surveillance Time Interval: Currently 5 or Not Applicable
3. Surveillance Delay: Currently 10 or Not Applicable

98. Return to Previous Menu

- **Surveillance**
  Can be set to Enabled or Disabled.
- **Surveillance Time Interval**
  Can be set to any number from 1 to 255 minutes.
- **Surveillance Delay**
  Can be set to any number from 0 to 255 minutes.

Surveillance time interval and surveillance delay can only be changed after surveillance is enabled.

Refer to [Service Processor System Monitoring - Surveillance](#) on page 63 for more information about surveillance.

- **Reset Service Processor**
  Allows the user to reinitialize the service processor.

- **Reprogram Service Processor Flash EPROM**
  This is an automatic process.

**Serial Port Snoop Setup Menu**

This menu can be used to setup Serial Port Snooping, in which the user can configure serial port 1 as a "catch-all" reset device.

From the main Service Processor menu, select option 1, Service Processor setup, then select option 8 (Serial Port Snoop Setup Menu).

<table>
<thead>
<tr>
<th>SERIAL PORT SNOOP SETUP MENU</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. System reset string:</td>
</tr>
<tr>
<td>Currently Unassigned</td>
</tr>
<tr>
<td>2. Snoop Serial Port:</td>
</tr>
<tr>
<td>Currently Unassigned</td>
</tr>
<tr>
<td>98. Return to Previous Menu</td>
</tr>
</tbody>
</table>

1>

Use the system reset string option to enter the system reset string, which resets the machine when it is detected on the main console on Serial Port 1.
Use the Snoop Serial Port option to select the Serial Port to Snoop.

**Note:** Only Serial Port 1 is supported.

After Serial Port Snooping is correctly configured, at any point after the system unit is booted to AIX, whenever the reset string is typed on the main console, the system unit uses the Service Processor reboot policy to restart. This action causes an EPOW (Early Power Off Warning) to be logged, and also an AIX dump to be created if the machine is at an AIX prompt, with AIX in such a state that it can respond. If AIX cannot respond, the EPOW record is created, rather than the AIX dump.

Pressing Enter after the reset string is not required, so make sure that the string is not common or trivial. A mixed-case string is recommended.

**System Power Control Menu**
The menu is used to set power control options.

```
SYSTEM POWER CONTROL MENU
1. Enable/Disable Unattended Start Mode: Currently Disabled
2. Ring Indicate Power-On Menu
3. Reboot/Restart Policy Setup Menu
4. Power-On System
5. Power-Off System
6. Enable/Disable Fast System Boot: Currently Disabled
7. Boot Mode Menu
98. Return to Previous Menu
99. Exit from Menus
```

**Enable/Disable Unattended Start Mode**

Use this option to instruct the service processor to immediately power-on the server after a power failure, bypassing power-on password verification. Unattended Start Mode can also be set using SMS menus. Unattended Start Mode can be used on servers that require automatic power-on after a power failure.
### Boot Mode Menu

Allows users to configure the system to automatically start a specific function on the next system start. This configuration applies to the next boot only and is reset to the default state of being disabled following a successful boot attempt.

- **Enabling the Boot to SMS Menu option**
  Causes the system to automatically enter the System Management Services menu during the boot process. Enabling this option is equivalent to pressing 1 on the attached ASCII terminal (or F1 on a graphics terminal) while the system initialization indicators display on screen.

- **Enabling the Service Mode Boot from Saved list option**
  Causes the system to automatically enter the Stand-alone diagnostics (see "Standalone Diagnostic Operation" on page 112 for more on Stand-alone diagnostics). Enabling this option is equivalent to pressing 5 on the attached ASCII terminal (or F5 on a graphics terminal) while the system initialization indicators display on screen.

- **Enabling the Service Mode Boot from Default List option**
  Causes the system to automatically enter the Online Diagnostics in Service Mode (see "Online Diagnostics Modes" on page 103 for more Online Diagnostics). Enabling this option is equivalent to pressing ‘6’ on the attached ASCII terminal (or F6 on a graphics terminal) while the system initialization indicators display on screen.

- **Enabling the Boot to Open Firmware Prompt option**
  Causes the system to automatically enter Open Firmware prompt (also called the OK prompt). Enabling this option is equivalent to pressing 8 on the attached ASCII terminal (or F8 on a graphics terminal) while the system initialization indicators display on screen (see page 149 for more information about Open Firmware prompt).

If more than one option is enabled, the system recognizes only the option corresponding to the smallest menu number. For example, if options 4 and 2 were enabled, the system recognizes only Option 2: Service Mode Boot from Saved List. After a boot attempt, all enabled options are disabled. In effect, the system throws away any menu options that are enabled after the option with the highest priority (the option with the smallest menu number) is executed.
The user can also override the choices in the Boot Mode Menu while the system initialization indicators display on the screen. For example, if the user had enabled the system to enter the SMS menus (option 1) but pressed the 8 key while the system initialization indicators displayed on the screen, the system would enter the Open Firmware prompt and disregards the settings in the Boot Mode Menu.

After the logo displays, the initialization icons display across the bottom of the screen.

- **Ring Indicate Power-On Menu**
  
  Ring Indicate Power-On is an alternate method of dialing in, without establishing a service processor session. If the system is powered off and Ring Indicate Power-On is enabled, the server is powered on at the predetermined number of rings. If the server is already on, no action is taken. In either case, the telephone call is not answered. The caller receives no feedback that the server is powered on. The Ring Indicate Power-On Menu and defaults are shown below:

  ```
  Ring Indicate Power-On Menu
  1. Ring indicate power-on:
     Currently Disabled
  2. Number of rings:
     Currently 6
  98. Return to Previous Menu
  ```

  The number of rings can be set to any number greater than zero.

- **Reboot/Restart Policy Setup Menu**, see "Reboot/Restart Policy Setup Menu" on page 59

- **Power-On System**
  
  Allows immediate power-on of the system. For other power-on methods, see "System Power-On Methods" on page 61

- **Power-Off System**
  
  Allows the user to power-off the server following a surveillance failure.

**System Information Menu**

This menu provides access to system configuration information, error logs, system resources, and processor configuration.
SYSTEM INFORMATION MENU

1. Read Progress Indicators from Last System Boot
2. Read Service Processor Error Logs
3. Read System POST Errors
4. Read NVRAM
5. Read Service Processor Configuration
6. View System Environmental Conditions
7. Processor configuration/deconfiguration Menu
10. Enable/Disable CPU Guard Menu
   Currently Enable
11. Enable/Disable MEM Guard
   Currently Enable
98. Return to Previous Menu
99. Exit from Menus

- **Read Progress Indicators from Last System Boot**
  Displays the boot progress indicators (checkpoints), up to a maximum of 100, from the system boot prior to the one in progress. This historical information can help to diagnose system faults.

  The progress indicators are displayed in two sections. Above the dashed line are the progress indicators (latest) from the boot that produced the current sessions. Below the dashed line are progress indicators (oldest) from the boot preceding the one that produced the current sessions.

  The progress indicator codes are listed from top (latest) to bottom (oldest). The dashed line represents the point where the latest boot started.

- **Read Service Processor Error Logs**
  Displays error conditions detected by the service processor.

  The time stamp in this error log is Coordinated Universal Time (CUT), also known as Greenwich Mean Time (GMT). AIX error logs have additional information available and are able to time stamp the errors with the local time. See page 68 for an example of the error log.

- **Read System POST Errors**
  Select this option to review the results of the POST (Power-On Self-Test). Your system unit may be able to start in the presence of POST errors if there is sufficient working system resources. If POST errors occur during start up, this error log, when used with the diagnostics, helps to isolate faults. See page 69 for an example of the POST error screen.

- **Read NVRAM**
  Displays nonvolatile random access memory (NVRAM) contents.

- **Read Service Processor Configuration**
  Displays current service processor configuration.

- **View System Environmental Conditions**
  The service processor reads all environmental sensors and reports the results to the user. Use this option when surveillance fails, because it allows the user to determine the environmental conditions that may be related to the failure.
The following is an example of the System Environmental Conditions screen:

```
System Environmental Conditions
(System Power is currently off.)

Fan 0: A stopped fan detected
Fan 1: A stopped fan detected
Fan 2: A stopped fan detected
Fan 3: A stopped fan detected
MEM Temperature is operating within normal tolerances
I/O Temperature is operating within normal tolerances
5.0 Volts: A low 5.0 Voltage reading detected
3.3 Volts: A low 3.3 Voltage reading detected
5.0 Standby Volts: is operating within normal tolerance
+12.0 Volts: A low +12.0 voltage reading detected
-12.0 Volts: A high -12.0 voltage reading detected
(Press Return to Continue)
```

**Processor Configuration/Deconfiguration Menu**

Use this option to view and modify processor configuration.

The following is an example of the Processor Configuration/Deconfiguration Menu:

```
Processor Configuration/Deconfiguration Menu

Processor number
0. Configured by system (0x0)
1. Configured by system (0x0)
2. Configured by system (0x0)
3. Configured by system (0x0)
98. Return to Previous Menu

To change the configuration, select the processor number
```

The user can manually configure or deconfigure any processor, regardless of failure status, through this Service Processor menu. The configuration process takes place during the system power-up. Therefore, the configuration displayed in STANDBY mode reflects the configuration during the last boot.

To view the current configuration, access the Service Processor menu after the system starts. When the user selects a processor, its state toggles between configured and deconfigured. Processors that are not present are not listed. A processor can be in any of the following four states:

- **Configured by system**: The processor is present, and has not exceeded the number of failure threshold. It is configured by the system and is available.
- **Deconfigured by system**: The processor is present, but has exceeded the number of failure threshold. It is deconfigured by the system and is currently unavailable.
- **Manually configured**: The processor is present and available. It is configured by the user through the service processor menus.
- **Manually deconfigured**: The processor is present, but unavailable. It has been deconfigured by the user through the service processor menus.
The following is an example of the Memory Configuration/Deconfiguration Menu:

```
Memory Configuration/Deconfiguration Menu
DIMMs on memory card number 0:
DIMMs on memory card number 1:
  1. Configured by system (0x0)
98. Return to Previous Menu
Enter card number _and_ DIMM number separated by a space
```

The user can manually configure or deconfigure any memory DIMM (Dual Inline Memory Module) regardless of failure status, through this Service Processor menu. The configuration process takes place during the system power-up. Therefore, the configuration displayed in STANDBY mode reflects the configuration during the last boot.

To view the current configuration, access the Service Processor menu after the system starts. When the user selects a memory DIMM, its state will toggle between configured and deconfigured. Memory DIMMs that are not present are not listed. A memory DIMM can be in any of the following four states:

- **Configured by system:** The memory DIMM is present, and has not exceeded the number of failure threshold. It is configured by the system and is available.
- **Deconfigured by system:** The memory DIMM is present, but has exceeded the number of failure threshold. It is deconfigured by the system and is currently unavailable.
- **Manually configured:** The memory DIMM is present and available. It is configured by the user through the service processor menus.
- **Manually deconfigured:** The memory DIMM is present, but unavailable. It has been deconfigured by the user through the service processor menus.

**Language Selection Menu**

The service processor menus and messages are available in different languages. This menu allows selecting languages into which service processor and system firmware menus and messages are displayed.
Call-In/Call-Out Setup Menu

This menu is used to configure a modem for the service processor to use to support the system.

**Modem Configuration Menu**

Two entries at the top of the Modem Configuration Menu display the status of the current selections. Selections are made in the two sections labeled Modem Ports and Modem Configuration File Name. Select the serial port that you want to activate and then select the modem configuration file for the modem on the port. To set up both serial ports with modems, make your selections one port at a time.

**Note:** Your ASCII terminal must support the ISO-8859 character set to correctly display languages other than English.
For information on choosing a modem configuration file, see "Sample Modem Configuration Files" on page 171 and "Transfer of a Modem Session" on page 175.

**Modem Configuration Menu**

Port 1 Modem Configuration File Name:  
Port 2 Modem Configuration File Name:  

To make changes, First select the port and then the configuration file name  

Modem Ports:  
1. Serial port 1

Telephone Number Setup Menu

Use the menu to set or change the telephone numbers for reporting a system failure.

Telephone Number Setup Menu

1. Service Center Telephone Number:
   Currently Unassigned

2. Customer Administration Center Telephone Number:
   Currently Unassigned

3. Digital Pager Telephone Number:
   Currently Unassigned

4. Customer Voice Telephone Number:
   Currently Unassigned

5. Customer System Telephone Number:
   Currently Unassigned

98. Return to Previous Menu

- **Service Center Telephone Number** is the number of the service center computer. The service center usually includes a computer that takes calls from servers with call-out capability. This computer is referred to as the catcher. The catcher expects messages in a specific format to which the service processor conforms. Contact your service provider for the correct service center telephone number to enter here. For more information about the format and catcher computers, refer to the README file in the AIX /usr/samples/syscatch directory.

- **Customer Administration Center Telephone Number** is the number of the System Administration Center computer (catcher) that receives problem calls from servers. Contact your system administrator for the correct telephone number to enter here.
- **Digital Pager Telephone Number** is the number for a pager carried by someone who responds to problem calls from your server. Contact your administration center representative for the correct telephone number to enter here. For test purposes, use a test number, which you can change later.

**Note:** Some modems, such as IBM 7857-017, are not designed for the paging function. Although they can be used for paging, they return an error message when they do not get the expected response from another modem. Therefore, even though the paging was successful, the error message causes the service processor to retry, continuing to place pager calls for the number of retries specified in the Call-Out policy Setup Menu. These retries result in redundant pages.

For digital pagers that require a personal identification number (PIN) for access, include the PIN in this field as shown in the following example:

`18001234567,,,,87654`

The commas create pauses for the voice response system, and the 87654 represents the PIN. The length of these pauses is set in modem register S8. The default is usually 1 or 2 seconds each.

- **Customer Voice Telephone Number** is the telephone number of a phone near the server or answered by someone responsible for the server. This is the telephone number left on the pager for callback. For test purposes, use a test number, which you can change later.

- **Customer System Telephone Number** is the telephone number to which your server’s modem is connected. The service or administration center representatives need this number to make direct contact with your server for problem investigation. This is also referred to as the call-in phone number.

### Call-Out Policy Setup Menu

This menu allows you to set call-out policy.

Call-Out Policy Setup Menu

1. Call-Out policy (First/All):
   - Currently First

2. Remote timeout, (in seconds):
   - Currently 120

   - Currently 2

4. Number of retries:
   - Currently 2

98. Return to Previous Menu

1>

- **Call-Out Test**

The Call-Out Test verifies if the Call-Out function is working properly. Before the Test, call-out must be enabled and the system configured properly for call-out.
During the setup, the user should have entered the phone numbers for the Digital Pager and Customer Voice for test purposes. These numbers are used to determine whether call-out is working during the Call-Out Test.

The Call-Out Test should cause the user’s phone to ring. If the test is successful, call-out is working properly. The user should now change the test Digital pager and Customers Voice number to the correct numbers.

Call-Out policy can be set to first or all. If call-out policy is set to first, the service processor stops at the first successful call out to one of the following numbers in the order listed:

1. Service Center
2. Customer Administration Center
3. Pager

If call-out policy is set to all, the service processor attempts a call out to the following numbers in the order listed:

1. Service Center
2. Customer Administration Center
3. Pager

- **Remote timeout** and **Remote latency** are functions of your service provider’s catcher computer. Either use the defaults or contact your service provider for recommended settings.
- **Number of retries** is the number of times you want the server to retry calls that resulted in busy signals or in other error messages.

**Customer Account Setup Menu**

This menu allows users to enter information that is specific to their account.

- **Customer account number** is assigned by your service provider for record-keeping and billing. If you have an account number, enter it. Otherwise, leave this field blank.
- **Customer RETAIN login userid** and **Customer RETAIN login password** apply to a service function to which your service provider may or may not have access. Leave these fields blank if your service provider does not use RETAIN.
Reboot/Restart Policy Setup Menu

Reboot describes bringing the system hardware back up from scratch, for example, from a system reset or power-on. The boot process ends when control passes to the operating system process.

Restart describes activating the operating system after the system hardware reinitialized. Restart must follow a successful reboot.

- **Number of reboot attempts** If the server fails to successfully complete the boot process, it attempts to reboot the number of times specified. Entry values equal to or greater than 0 are valid. Only successive failed reboot attempts count, not reboots that occur after a restart attempt. At restart, the counter is set to 0.

- **Use OS-Defined restart policy** lets the service processor react or not react the same as the operating system to major system faults, by reading the setting of the operating system parameter *Automatically Restart/Reboot After a System Crash*. This parameter may or may not be defined, depending on the operating system or its version and level. If the operating system automatic restart setting is defined, then it can be set to respond to a major fault by restarting or by not restarting. See your operating system documentation for details on setting up operating system automatic restarts. The default value is Yes.

- **Enable supplemental restart policy** - The default setting is No. If set to Yes, the service processor restarts the system when the system loses control as detected by the service processor surveillance, and either:
  - The **Use OS-Defined restart policy** is set to No. OR
  - The **Use OS-Defined restart policy** is set to Yes, and the operating system has NO automatic restart policy.

Refer to [Service Processor Reboot/Restart Recovery](#) on page 63.

- **Call-Out before restart** If a restart is necessary due to a system fault, you can enable the service processor to call out and report the event. This option can be valuable if the number of these events becomes excessive, signalling a bigger problem.

The following table describes the relationship among the operating system and service processor restart controls:
Service Processor Functions

This section provides detailed information about the service processor functions.

The 44P Series Model 170 supports the functions listed in the following table:

<table>
<thead>
<tr>
<th>Built-in Functions</th>
<th>Initialization and Test</th>
<th>Service Processor Functions</th>
</tr>
</thead>
<tbody>

### System Power-On Methods

This section discusses the following system power-on methods:

- **Power-on Switch**
- **Remote Power-on via Ring-Indicate Signal**

The server automatically powers on when it detects a "ring indicate" signal from a modem attached to one of the integrated serial ports.

A remote user can call the server to activate ring detection by the modem. Listen for a few more rings than the threshold number for starting the system and then hang up. The default threshold is one ring.
Wait 5 minutes for the server to initialize and then call again using an ASCII terminal. The server responds by requesting a password, if set, or presenting the service processor menus. The remote user now has control of the server.

**Note:** For security, if the system is powered on by the remote power-on via ring indicate signal and the service processor detects an operator panel battery failure, the service processor causes the system to power off. See [Service Processor Call-In Security](#) for more information.

- **Unattended start mode** - refer to **Enable/Disable Unattended Start Mode** on page 48.

  The Service Processor can be enabled to recover from the loss of ac power (see Enable/Disable Unattended Power-On Mode in the SYSTEM POWER CONTROL MENU). When ac power is restored, the system returns to the then current power state at the time ac loss occurred. For example, if the system was powered-on when ac loss occurred, it reboots/restarts when power is restored. If the system was powered-off when ac loss occurred, it remains off when power is restored.

- **Timed power-on** - refer to the `shutdown -t` command on servers using AIX.

  Working in conjunction with AIX, the Service Processor in your server can operate a timer, much like the wake-up timer on your clock radio. You can set the timer so that your server powers on at a certain time after shutting down. The timer is battery operated, so power interruptions occurring while the server is off do not affect its accuracy. Refer to the AIX `shutdown -t` command for details on setting the timer.

  **Note:** If an ac power loss is in progress when the Timed Power-On attempt occurs, the server is not able to power on when ac power is restored.

- **Follow-up to a Failed Boot Attempt**

  The service processor initiates a power-on sequence if a failed boot attempt is detected (due to a hardware or software failure).

- **Fast/Slow Boot (IPL) Capabilities**

  Using the operator-panel functions, you can select the IPL type, mode, and speed of your boot capabilities. For more information, refer to operator panel functions 01 and 02.

  **Attention:** Selecting fast IPL results in several diagnostic tests being skipped.

---

### Service Processor Call-In Security

If the service processor detects bad battery-powered storage (indicating that the battery in the operator panel has failed or is disconnected), it maintains server security by disabling the call-in capability to both serial ports.

When call-in is disabled, the system can still be powered on by using the ring-indicator signal, but the service processor then causes the system to power down, preventing access to any system facilities or to AIX.

After battery power is restored, the password(s) must be reset and the call-in function(s) enabled. Both of these operations can be performed from Service Processor menus. See [Serial Port Selection Menu](#) on page 58.
Service Processor Reboot/Restart Recovery

Reboot describes bringing the system hardware back up; for example, from a system reset or power-on. The boot process ends when control passes to the operating system process.

Restart describes activating the operating system after the system hardware is reinitialized. Restart must follow a successful reboot.

Boot (IPL) Speed

When the server enters reboot recovery, slow IPL is automatically started, which gives the POST an opportunity to locate and report any problems that may otherwise be untested.

Failure During Boot Process

During the boot process, either initially after system power-on or upon reboot after a system failure, the Service Processor monitors the boot progress. If progress stops, the Service Processor can reinitiate the boot process (reboot) if enabled to do so. The Service Processor can re-attempt this process according to the number of retries selected in the Reboot/Restart Policy Setup Menu.

Failure During Normal System Operation

When the boot process completes and control transfers to the operating system (OS), the service processor can monitor operating system activity (see the Set Surveillance Parameters option in the SERVICE PROCESSOR SETUP MENU). If OS activity stops due to a hardware-or software-induced failure, the service processor can initiate a reboot/restart process based on the settings in the Service Processor Reboot/Restart Policy Setup Menu and the OS automatic restart settings (see the operating system documentation).

If you are using the AIX operating system, the menu item under SMIT for setting the restart policy is Automatically Reboot After Crash (True/False). The default is False. When the setting is True, and if the service processor parameter “Use OS-Defined Restart Policy” is Yes (the default), Service Processor takes over for AIX to reboot/restart after a hardware or surveillance failure.

Service Processor Reboot/Restart Policy Controls

The operating system’s automatic restart policy (see operating system documentation) indicates the operating system response to a system crash. The service processor can be instructed to refer to that policy by the Use OS-Defined Restart Policy setup menu.

Processor Boot-Time Deconfiguration (CPU Repeat-Gard)

Processor boot time deconfiguration allows for the removal of processors from the system configuration at boot time. The objective is to minimize system failure or data integrity exposure due to a faulty processor.

This function uses processor hardware Built-In Self-Test (BIST) and firmware Power-On Self-Test (POST) to discover and isolate processor hardware failures during boot time.
It also uses the hardware error detection logic in the processor to capture run-time recoverable and irrecoverable error indications. The firmware uses the error signatures in the hardware to analyze and isolate the error to a specific processor.

The processors that are deconfigured remain off-line for subsequent reboots until the faulty processor hardware is replaced.

This function allows users to manually deconfigure or re-enable a previously deconfigured processor through the Service Processor menu. The user can also enable or disable this function through the Service Processor.

**Processor Run-Time Deconfiguration (CPU-Gard)**

Processor run-time deconfiguration allows for the dynamic removal of CPUs from the system configuration. The objective is to minimize system failures or data integrity exposures due to a faulty processor. The processor to be removed is the one that has experienced repeated run-time recoverable internal errors (over a predefined threshold).

The function uses the hardware error detection logic in the processor to capture run-time recoverable error indications. The firmware uses the error signatures in the hardware to analyze and isolate the error to a specific CPU. The firmware also maintains error-threshold information.

When an internal recoverable error for a processor reaches a predefined threshold, the firmware notifies the AIX operating system. The AIX operating system migrates all software processes and interrupts to another processor and puts the faulty processor in stop state.

CPUs that are deconfigured at run time remain off-line for subsequent reboots through the CPU Boot Time Deconfiguration function, until the faulty CPU hardware is replaced. The user can also enable or disable this function via the AIX system management function.

**Memory Boot-Time Deconfiguration (Memory Repeat-Gard)**

Memory boot time deconfiguration allows for the removal of a memory segment or DIMM from the system configuration at boot time. The objective is to minimize system failures or data integrity exposure due to faulty memory hardware. The hardware resource(s) to be removed are the ones that experienced the following failures:

- A boot-time test failure.
- Run-time recoverable errors over threshold prior to the current boot phase.
- Run-time irrecoverable errors prior to the current boot phase.

This function uses firmware Power-On Self-Test (POST) to discover and isolate memory hardware failures during boot time. It also uses the hardware error detection logic in the memory controller to capture run-time recoverable and irrecoverable error indications. The firmware uses the error signatures in the hardware to analyze and isolate the error to the specific memory segment or DIMM.
The memory segment or DIMM that is deconfigured remains off-line for subsequent reboots until the faulty memory hardware is replaced.

The function allows users to manually deconfigure or re-enable a previously deconfigured memory segment/DIMM through the Service Processor menu. The user can also enable or disable this function through the Service Processor menu.

---

### Service Processor System Monitoring - Surveillance

Surveillance is a function in which the service processor monitors the system, and the system monitors the service processor. This monitoring is accomplished by periodic samplings called heartbeats.

Surveillance is available during two phases:

- System firmware bring-up (automatic)
- Operating system run time (optional)

### System Firmware Surveillance

System firmware surveillance provides the service processor with a means to detect boot failures while the system firmware is running.

System firmware surveillance is automatically enabled during system power-on. It cannot be disabled by the user.

If the service processor detects no heartbeats during system boot (for 7 minutes), it cycles the system power to attempt a reboot. The maximum number of retries is set from the service processor menus. If the fail condition repeats, the service processor leaves the machine powered on, logs an error, and displays menus to the user. If Call-out is enabled, the service processor calls to report the failure and displays the operating-system surveillance failure code on the operator panel.

### Operating System Surveillance

The operating system surveillance provides the service processor with a means to detect hang conditions, as well as hardware or software failures, while the operating system is running. It also provides the operating system with a means to detect service processor failure caused by the lack of a return heartbeat.

Operating system surveillance is enabled by default, allowing the user to run operating systems that do not support this service processor option.

You can also use Service Processor Menus and Service Processor Service Aid to enable or disable operating system surveillance.

For operating system surveillance to work correctly, you must set the following parameters:

- Surveillance enable/disable
- Surveillance interval
This is the maximum time (in minutes) the service processor should wait for a heartbeat from the operating system before timeout.

- Surveillance delay
  This is the length of time (in minutes) for the service processor to wait from when the operating system is started to when the first heartbeat is expected.

Surveillance takes effect immediately after the parameters are set from the service processor menus.

If operating system surveillance is enabled (and system firmware has passed control to the operating system), and the service processor does not detect any heartbeats from the operating system, the service processor assumes the system is hung. The machine is left powered on and the service processor enters standby phase, displaying the operating system surveillance failure code on the operator panel. If Call-out is enabled, the service processor calls to report the failure.

Call Out

The service processor can call out when it detects one of the following conditions:

- System firmware surveillance failure
- Operating system surveillance failure (if supported by the operating system)
- Critical environmental failures
- Restarts

To enable the call-out feature, do the following:

1. Have a modem connected to serial port 1 or 2
2. Set up the following using the service processor Menus or Diagnostic Service Aids:
   - Enable call out for the serial port where the modem is connected.
   - Set up serial port line speed.
   - Enter the modem configuration filename.
   - Set up site-specific parameters (such as phone numbers for call out and call out policy).
   - To call out before restart, set Call-Out before restart to ENABLED from the Reboot/Restart Policy Setup menu.

Note: Some modems, such as IBM 7857-017, are not designed for the paging function. Although they can be used for paging, they return an error message when they do not get the expected response from another modem. Therefore, even though the paging was successful, the error message causes the service processor to retry, continuing to place pager calls for the number of retries specified in the Call-Out policy Setup Menu. These retries result in redundant pages.
Console Mirroring

Console mirroring allows a user on a local ASCII terminal to monitor the service processor activities of a remote user. Console mirroring ends when the service processor releases control of the serial ports to the system firmware.

Using this option the user can set the modem connection, remote sessions, and console mirroring.

- service processor
- Modem connected to one serial port and enabled for incoming calls
- Local ASCII terminal connected to the other serial port. This local terminal can be connected directly to your server or connected through another modem.

Remote console mirroring can be invoked in three ways:
1. Remote session first, then local session added
2. Remote session already in progress.
3. Remote user uses the service processor menus to enable console mirroring, allowing both consoles to be active.

Local console mirroring can be invoked in three ways:
1. Local session first, then remote session added
2. Local session is already in progress.
3. The service processor receives a call from the remote user.
4. The local user selects the option to enable console mirroring. The service processor immediately begins mirroring service processor menus.

Note: To disconnect quickly, press Ctrl+D on either console, and both sessions will exit the service processor menus.

Service Processor Firmware Updates

Attention: Only the service processor firmware can be updated from the service processor menus; the system firmware cannot be updated from the service processor menus. A service processor firmware update always requires a companion system firmware update which must be applied first. For this reason, updating only the service processor firmware using the service processor menus is not recommended. Go to the RS/6000 support web site at http://www.rs6000.ibm.com/support/micro to download the latest firmware levels and update instructions.

The service processor firmware update image must be written onto a DOS-formatted diskette. The update image can be obtained from the RS/6000 support web site: http://www.rs6000.ibm.com/support/micro.

After the update diskette has been made, from the service processor main menu, select "Service Processor Setup". Then select "Reprogram Service Processor Flash EPROM".
The program requests the update diskette(s) as they are needed. The service processor will automatically reboot after the firmware update is complete.

**Service Processor Error Log**

The service processor error logs contain error conditions detected by the service processor.

```
Error Log
19991118165344  1. 48276851 CPU BIST fail detected
FRUs to replace: P1-C1

Press 'C' to clear error log, any other key to continue. >
```

The time stamp in this error log is Coordinated Universal Time (CUT), also known as Greenwich Mean Time (GMT). AIX error logs have more information available and are able to time stamp with local time.
System POST Errors

If POST (Power-On Self-Test) errors occur during startup, this error log helps isolate faults when used with the diagnostics.

Read System POST Errors

(Press Return to Continue)

Service Processor Operational Phases

This section provides a high-level flow of the phases of the service processor.

SP Power Applied

Pre-Standby Phase

Standby Phase SP Menus Available
Bring-Up Phase SMS Menus Available
Runtime Phase AIX Login Prompt Available

Pre-Standby Phase

This phase is entered when the server is connected to a power source. The server may or may not be fully powered on. This phase is exited when the Power-On Self-Tests (POST) and configuration tasks are completed.

The Pre-Standby phase components are:

• Service Processor Initialization - Performs any necessary hardware and software initializations.
- Service Processor POST - Conducts Power-On Self-Tests on its various work and code areas.
- Service Processor Unattended Start Mode Checks - To assist fault recovery. If unattended start mode is set, the service processor automatically reboots the server. The service processor does not wait for user input or power-on command, but moves through the phase and into the Bring-up Phase. Access SMS menus or &sp menus to reset the unattended start mode.

Standby Phase
The standby phase can be reached in either of two ways:
- With the server off and power connected (the normal path), recognized by OK in the LCD display. OR
- With the server on after an operating system fault, recognized by STBY or an 8-digit code in the LCD display.

In the Standby phase, the service processor takes care of some automatic duties and is available for menu operation. The service processor remains in the standby phase until a power-on request is detected.

The Standby phase components are as follows:
- Modem Configuration
  The service processor configures the modem (if installed) so that incoming calls can be received or outgoing calls can be placed.
- Dial In
  Monitor incoming phone line to answer calls, prompt for a password, verify the password, and remotely display the standby menu. The remote session can be mirrored on the local ASCII console if the server is so equipped and the user enables this function.
- Menus
  The service processor menus are password-protected. Before you can access them, you need either the General User (General Access Password or GAP) or Privileged User (Privileged Access Password or PAP).

Bring-Up Phase
This phase is entered upon power-on, and exited upon loading of the operating system.

The Bring-Up phase components are:
- Retry Request Check
  The service processor checks to see if the previous boot attempt failed. If two consecutive failures are detected, the service processor displays an error code and places an outgoing call to notify an external party if the user has enabled this option.
- Dial Out
  The service processor can dial a preprogrammed telephone number in the event of an IPL failure. The service processor issues an error report with the last reported IPL status indicated and any other available error information.
• Update Operator Panel
  The service processor displays Operator Panel data on the ASCII terminal if a
remote connection is active.
• Environmental Monitoring
  The Service Processor provides expanded error recording and reporting.
• System Firmware Surveillance (Heartbeat Monitoring)
  The service processor monitors and times the interval between system firmware
heartbeats.
• Responding to System Processor Commands
  The service processor responds to any command issued by the system processor.

Run-time Phase
This phase includes the tasks that the service processor performs during steady-state
execution of the operating system.
• Environmental Monitoring
  The Service Processor monitors voltages, temperatures, and fan speeds (on some
servers).
• Responding to System Processor Commands
  The service processor responds to any command issued by the system processor.
• Run-Time Surveillance (Heartbeat Monitoring)
  If the device driver is installed and surveillance enabled, the service processor
monitors the system heartbeat. If the heartbeat times out, the service processor
places an outgoing call. This is different from the Bring-up Phase scenario where two
reboot attempts are made before placing an outgoing call.

Service Processor Procedures in Service Mode
When the system is in service mode, the following service processor parameters are
suspended:
• Unattended Start Mode
• Reboot/Restart Policy
• Call-Out
• Surveillance

When service mode is exited, the service processor parameters revert to the customer
settings.
Chapter 4. System Management Services

Use the System Management Services menus to view information about your computer and to perform such tasks as setting passwords and changing device configurations.

If you have chosen a graphical display as your system console, you can use the graphical System Management Services described below. If you are using an ASCII display as your system console, see "Text-Based System Management Services" on page 94.

Graphical System Management Services

To start the Graphical System Management Services, turn on or restart the computer.

The firmware version installed in your system unit is displayed at the bottom right corner of the initial logo screen. Note the version number; processor upgrades may require a specified version of firmware to be installed in your system unit. (Update System Firmware is an option under the Utilities menu in the System Management Services.)

After the logo is displayed, initialization icons display across the bottom of the screen.

To enter the Graphical System Management Services, you must press the F1 key after the keyboard icon displays during startup and before the tone.

If you have pressed the F1 key, the System Management Services menu displays after the initialization and power-on self-test (POST) are complete.

Note: If you have installed a privileged-access password, you are prompted for this password before you gain access to the System Management Services menu.

After the System Management Services starts, the following screen displays.
You can also press F8 here to enter the open firmware 0K> prompt.

The System Management Services screen contains the following choices.

- **Config**: Enables you to view your system setup. Go to "Config" on page 75.

- **Multiboot**: Enables you to set and view the default operating system, modify the boot sequence, access the Open Firmware command prompt, and work with other options. Go to "Multiboot" on page 76.
Utilities: Enables you to set and remove passwords, enable the unattended start mode, set and view the addresses of your system’s SCSI controllers, select the active console, view or clear the firmware error log, and update your system unit’s firmware program. Go to Utilities on page 79.

Exit: Returns you to the previous screen.

To select an icon, move the cursor with the arrow keys to choose which icon is highlighted, then press the Enter key. You can also select an icon by clicking on it with your left mouse button. To leave the current screen, either press the Esc key or select the Exit icon.

Config

By selecting this icon, you can view information about the setup of your system unit. A list similar to the following displays when you select the Config icon.
If more than one screen of information is available, a blue arrow displays in the top right corner of the screen. Use the Page Up and Page Down keys to scroll through the pages.

**Multiboot**

The options available from this screen allow you to view and set various options regarding the operating system and boot devices.
The following describes the choices available on this screen.

**Select Software:** This option, if supported by the operating system, allows you to choose which operating system to use. Choosing an operating system causes the system to start. This option is supported by AIX. However, not all operating systems support this option.

If you receive an informational message saying that no operating system is installed, then the system information in nonvolatile storage may have been lost. This situation can occur if the battery has been removed. To correct this situation, refer to the **bootlist** reference in your AIX operating system documentation.

**Software Default:** This option, if supported by the operating system, enables you to select a default operating system for your system unit.
Install From: Enables you to select a media drive from which to install an operating system. Selection of a device is done using the spacebar.

Boot Sequence: Enables you to view and change the custom boot list (the sequence in which devices are searched for operating system code). You may choose from 1 to 5 devices for the custom boot list.

The default boot sequence is:
1. Primary diskette drive
2. CD-ROM drive
3. Tape drive
4. Hard disk drive
5. Network device

To change the custom boot list, enter a new order in the New column, then click on the Save icon. The list of boot devices is updated to reflect the new order.

Attention: To change the custom boot list back to the default values, click on Default. If you change your startup sequence, you must be extremely careful when performing write operations (for example, copying, saving, or formatting). You can accidentally overwrite data or programs if you select the wrong drive.

OK Prompt: Enables you to go directly to the Open Firmware command prompt. The Open Firmware command prompt is used for debugging and device driver development. For more information about the operation of the Open Firmware command prompt, refer to IEEE Standard 1275.

Note: This is for debugging and device development only. Do not invoke this feature if you are not familiar with Open Firmware. To exit from the command prompt, restart your system.

Multiboot Startup: Clicking on this button toggles whether the Multiboot menu displays automatically at startup.
Utilities

Selecting this icon enables you to perform various tasks and view additional information about your system unit.

The following describes the choices available on this screen.

**Password**: Enables you to set password protection for turning on the system unit and for using system administration tools. Go to "Password" on page 83.

**Spin Delay**: Enables you to change the spin-up delay for SCSI hard disk drives attached to your system. Go to "Spin Delay" on page 85.
Error Log: Enables you to view and clear the firmware error log information for your system unit. Go to Error Log on page 83.

RIPL (Remote Initial Program Load): Enables you to select a remote system from which to load programs through a network adapter when your system unit is first turned on. This option also allows you to configure network adapters that are required for RIPL. Go to RIPL on page 88.

SCSI ID: Allows you to view and change the addresses (IDs) of the SCSI controllers attached to your system unit. Go to SCSI ID on page 91.

Firmware Update: Allows you to update the system firmware program. Go to Firmware Update on page 92.

Select Console: Allows the user to select which console the user would like to use to display the SMS Menus. This selection is only for the SMS Menus and does not affect the display used by the AIX operating system.

Follow the instructions that display on the screen, select the console from the screen. Press F1, the system will start the boot to AIX. Go to Select Console on page 104.

Password
Select this icon to perform password-related tasks.

Power-On Access

Set

Remove

Remote <Off>

Privileged Access

Set

Remove

Exit

Power-On Password

Setting a **Power-On Access** password helps protect information stored in your system unit. If a Power-On Access password is set for your system unit, the Power-On Access status icon is shown in the locked position. If a Power-On Access password is not set, then the Power-On Access status icon is shown in the unlocked position (as shown in the screen above).

When you select the **Set** icon, a screen with eight empty boxes displays. Type your password in these boxes. You can use any combination of up to eight characters (A–Z, a–z, and 0–9) for your password. As you type a character, a key displays in the box.
Press Enter when you are finished; you must type the password again for verification.

If the two password entries do not match, an error icon displays with a message:
Password was attempted to be set and an error code Power-On Access: 20E00000 displays.

**Note:** If you *forget* the Power-On Access password, you can erase the password by shutting down the system unit and removing the battery for at least 30 seconds.

A password becomes effective only after the system is turned off and back on again.

**Remote Mode:** The remote mode, when enabled, allows the system to start from the defined boot device. This mode is ideal for network servers and other system units that operate unattended. When the remote mode is set, the icon label changes to Remote <On>. 
Note: To use the remote mode feature for booting unattended devices, you must enable the unattended start mode. See the "System Power Control Menu" on page 48 for instructions on enabling the unattended start mode, which allows the system unit to turn on whenever ac power is applied to the system (instead of having the system unit wait for the power button to be pushed).

Privileged-Access Password

The privileged-access password protects against the unauthorized starting of the system programs. Select the Set icon to set and verify the privileged-access password.

When you select the Set icon, a screen with 8 empty boxes displays. Type your password in these boxes. You can use any combination of up to eight characters (A–Z, a–z, and 0–9) for your password. As you type a character, a key displays in the box.

Press Enter when you are finished; you must type the password again for verification.
If you type the password incorrectly, press the Esc key and start again.

If the two password entries do not match, an error icon displays with a message: Password was attempted to be set and an error code Privileged Access: 20E00001 displays.

If you previously had set a privileged-access password and want to remove it, select the Remove icon.

After you have selected the remove icon. The privileged-access status icon flashes and changes to the unlock position to indicate that the privileged-access not set.

**Note:** After you have entered and verified the password, the privileged-access password icon flashes and changes to the locked position to indicate that your system unit now requires the password that you just entered before running system programs.

**Attention:** If no user-defined bootlist exists and the privileged-access password has been enabled, you are asked for the privileged-access password at startup every time you boot your system.
Spin Delay

Select this icon to change the spin-up delay for SCSI hard disk drives attached to your system. Spin-up delay values can be entered manually or you can use a default setting. All values are measured in seconds. The default is two seconds. After you have entered the new Spin-up delay values, use the arrow keys to highlight the **Save** icon and press Enter.

<table>
<thead>
<tr>
<th>&lt;Hard Disk Spinup Delay&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Current Spin Up Value - 2</strong></td>
</tr>
<tr>
<td><strong>Enter New Value (&gt;1)</strong></td>
</tr>
</tbody>
</table>

Save  Default  Exit

ErrorLog

Selecting this icon displays the log of errors that your system unit has encountered during operations.
Selecting the **Clear** icon erases the entries in this log.

This error log only shows the first and last errors.

### System Error Log

<table>
<thead>
<tr>
<th>Date</th>
<th>Time</th>
<th>Error Code</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>96/01/29</td>
<td>00:51:32</td>
<td>12345678</td>
<td>00000000</td>
</tr>
<tr>
<td>2. No entry</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**RIPL**

Selecting the **RIPL** icon gives you access to the following selections.
The **Set Address** icon allows you to define addresses from which your system unit can receive RIPL code.
If any of the addresses is incomplete or contains a number other than 0 to 255, an error message displays when you select the **Save** icon. To clear this error, correct the address and select **Save** again.

**Attention:** If the client system and the server are on the same subnet, set the gateway IP address to [0.0.0.0].

To change an address, press the backspace key on the highlighted address until the old address is completely deleted. Then enter the new address.

**Ping**

The **Ping** icon allows you to confirm that a specified address is valid by sending a test transmission to that address.
To change an address, press the backspace key on the highlighted address until the old address is completely deleted. Then enter the new address.

Selecting the Ping icon displays a screen in which you select the communications (token-Ring or Ethernet) to be used to send test transmissions.
To use this screen, do the following:

1. Use the arrow keys or mouse to highlight an adapter to configure.
2. Press the spacebar to select the adapter.
3. Highlight the Ping icon and press Enter to send the test transmission.

Config

The Config icon allows you to configure network adapters which require setup.

Selecting the Config icon causes a list of the adapters requiring configuration to display.

To use this screen, do the following:
1. Use the arrow keys or mouse to highlight an adapter to configure.
2. Press the spacebar to select the adapter.
3. Highlight the OK icon and press Enter.
Select this icon to view and change the addresses (IDs) of the SCSI controllers attached to your system unit. To change a SCSI controller ID, highlight the entry by moving the up or down arrow keys, then use the spacebar to scroll through available IDs. After you have entered the new address, use the left or right arrow keys or mouse to highlight the Save icon and press Enter.

At any time in this process, you can select the Default icon to change the SCSI IDs to the default value of 7.
Firmware Update

Select this icon to update the system or service processor firmware in your system unit from an image on a 3.5 inch diskette.

To update system and service processor firmware, use the Diagnostics Service Aid under AIX. To obtain firmware updates, as well as update instructions, see the following Web address: http://www.rs6000.ibm.com/support/micro

If you are not able to obtain firmware updates or instructions from this Web address, contact your service representative for assistance.
Only use the Firmware Update utility described here if instructed by an authorized representative, or by instructions from the Web address listed above, or during the recovery of damaged firmware.

When you are prompted, insert the firmware update diskette containing the new firmware image.

**Attention:** While the new firmware image is being copied into your system unit, you must not turn off the system unit. Turning off the system unit during the update process may render your system unit inoperable.

After the firmware update is complete, shut down and restart the system unit.

If the firmware update does not complete successfully or the system unit does not restart after the firmware update, contact your authorized reseller or marketing representative.

**Firmware Recovery**

If a troubleshooting procedure has indicated that the system firmware unit has been damaged, it may be possible to recover it. For example, if the system hangs during startup with E1EA displayed on the operator panel, the system firmware has been damaged but may be recovered.

To recover a damaged system firmware, do the following:

1. Create a firmware recovery diskette. This must be a 3.5” high-density (1.44 MB) diskette that has been formatted for DOS.
2. Obtain the system firmware update image file from one of the following sources:
   a. From the Web address: http://www.rs6000.ibm.com/support/micro
   b. From an service representative if you cannot access the Web address.
3. Copy the system firmware update image file to the recovery diskette, naming it PRECOVER.IMG. The file must be written in DOS format.
4. When the system stops booting, for example at E1EA, insert the recovery diskette. If the diskette drive LED does not light up, power the system unit off, then back on again.
5. If the recovery procedure is successful, the system will continue starting up and display checkpoints of the form E1XX.
6. Enter the System Management Service menu. When the keyboard indicator displays, press the 1 key if the system console is an ASCII terminal. If the system console is a graphics display and directly attached keyboard, press the F1 key.
7. When the main menu displays, choose Utilities, then perform a firmware update of the system firmware as described on page "Firmware Update" on page 93.
Text-Based System Management Services

The text-based Open Firmware command line and System Management Services are available if an ASCII terminal is attached to your system unit. The text-based Open Firmware command line allows you to configure some adapters, and the System Management Services makes it possible for you to view information about your system unit and to perform such tasks as setting passwords and changing device configurations.

To start the text-based System Management Services instead of the Open Firmware command line, press the number 1 key on the ASCII terminal keyboard when the keyboard text symbol displays during startup. After the text-based System Management Services starts, the following screen displays.

Note: The version of firmware currently installed in your system unit is displayed at the top of each screen in the text-based System Management Services. Note the version number. Processor and other device upgrades may require the specified version of firmware to be installed in your system unit. Update System Firmware is an option under the Utilities menu.

System Management Services

1 Display Configuration
2 Multiboot
3 Utilities
4 Select Language

After you have finished using the text-based System Management Services, type x (for exit) to start your system unit. The x takes you back to the prior screen.

Display Configuration

This option provides information about the setup of your system unit. A screen similar to the following is displayed.
Use this screen to view and set various options regarding the operating system and boot sequence.

Select Software: If this option is supported by the operating system, shows the name of the operating system installed. This option may not be supported by all operating systems.
If you are running on AIX and you receive the following message:

```
No Operating System Installed
```

this indicates that information in nonvolatile storage could have been lost, as would happen if the battery had been removed. To re-create this value, run the `bootlist` command under AIX with the appropriate parameters as to the location of the operating system in a particular hard disk. See the `bootlist` command in your AIX documentation.

**Software Default:** If supported by the operating system, lets you select the default operating system to start the system. This option may not be supported by all operating systems.

**Select Install Device:** Produces a list of devices, for example the CD-ROM, from which the operating system is installed. Select a device and the system searches the device for an operating system to install and if supported by the operating system in that device, the name of the operating system displays.

**Boot Device:** Provides a list of devices that can be selected to be stored on the boot list. Up to five devices are supported.

**OK Prompt:** Provides access to the Open Firmware command prompt.

**Multiboot Startup:** Toggles between OFF and ON and selects whether the Multiboot menu invokes automatically on startup.

### Select Boot Device

Select this option to view and change the custom boot list, which is the sequence of devices read at startup time.

```
Select Boot Devices
1 Display Current Settings
2 Restore Default Settings
3 Configure 1st Boot Device
4 Configure 2nd Boot Device
5 Configure 3rd Boot Device
6 Configure 4th Boot Device
7 Configure 5th Boot Device

[ ] Exit

--->
```

**Display Current Settings:** Lists the current order of devices in the boot list. The following screen shows an example of this display.
Current Boot Device
1. Diskette
2. Ethernet (Integrated)
3. SCSI CD-ROM id=3 (slot=1)
4. SCSI 4.5 GB Hard Disk id=6 (slot=1)
5. SCSI 4.5 GB Hard Disk id=5 (slot=5)

---

[X-Exit]

**Restore Default Settings**: Restores the boot list to the default device of:

1. Primary diskette drive
2. CD-ROM drive
3. Tape drive
4. Hard disk drive
5. Network device.

**Attention**: To change the custom boot list back to the default values, select the **Default**. If you change your startup sequence, you must be extremely careful when performing write operations (for example, copying, saving, or formatting). You can accidentally overwrite data or programs if you select the wrong drive.

**Configure Nth Boot Device**

In the description below, **Nth** can be **1st, 2nd, 3rd**, etc. depending on your choice on the previous menu.

Options display a screen similar to the following:
Type the device number of the device name that you want to select as the Nth boot device. For example, if you entered this menu by selecting 4 on the previous menu (configure 2nd Boot Device), then enter the number 3 based on the list shown above. You are thus selecting the SCSI CD-ROM device to be the 2nd (Nth) device in the boot sequence.

Utilities

The Utilities screen enables you to select from the following system management tools.

Utilities

1 Set Passwords and Unattended Start Mode
2 SCSI Spin up
3 Display Error Log
4 Remote Initial Program Load Setup
5 Change SCSI id
6 Update System Firmware
7 Update Service Processor Firmware
8 Select Console

Set Password and Unattended Start Mode

Entering this selection permits access to the following options.
Set Power-On Access Password
Setting a Power-On Access password helps protect information stored in your computer. You can use any combination of up to eight characters (A–Z, a–z, and 0–9) for your password. The password you type is not displayed on the screen. Press Enter when you are finished; you must type the password again for verification. Passwords are not case-sensitive upon entry.

If you previously had set a Power-On Access password and want to remove it, select Remove Power-On Access Password.

Note: If you forget the Power-On Access password, the battery must be removed for longer than 30 seconds to reset the NVRAM. The system unit power cable must be disconnected before removing the battery.

A password becomes effective only after the system is turned off and back on again.

Unattended Start Mode:
Note: Unlike other systems, unattended start mode is not automatically disabled when the Power-On Access password is removed.

Set Privileged-Access Password
The privileged-access password protects against the unauthorized starting of the system programs.

Attention: If the privileged-access password has been enabled, you are asked for the privileged-access password at startup every time you boot your system.

If you previously had set a privileged-access password and want to remove it, select Remove Privileged-Access Password.
SCSI Spin Up

Selecting this utility allows you to adjust the hard disk spin-up delay in your system unit.

Display Error Log

Use this option to view or clear your system unit’s error log. A screen similar to the following displays when you select this option.

![Error Log Screen]

Note: The time stamp in his error log is Coordinated Universal Time (CUT), which is also referred to as Greenwich Mean Time (GMT). AIX error logs have more information available and can time stamp with your local time.

Remote Initial Program Load Setup

This option allows you to enable and set up the remote startup capability of your system unit. You must first specify the network parameters.

Network Parameters

1. IP Parameters
2. Adapter Parameters
3. Ping

Selecting the IP (Internet Protocol) Parameters option displays the following screen.
To change IP Parameters, type the number of the parameters for which you want to change the value.

**Attention:** If the client system and the server are on the same subnet, set the gateway IP address to [0.0.0.0].

Selecting the Adapter Parameters option allows you to view an adapter’s hardware address, as well as configure network adapters that require setup. A screen similar to the following displays:

<table>
<thead>
<tr>
<th>Device</th>
<th>Slot</th>
<th>Hardware Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>ethernet</td>
<td>3</td>
<td>0004AC5E88D2</td>
</tr>
<tr>
<td>token-ring</td>
<td>5</td>
<td>0020357A0530</td>
</tr>
<tr>
<td>ethernet</td>
<td>Integrated</td>
<td>0004ACE48208</td>
</tr>
</tbody>
</table>

Selecting an adapter on this screen displays configuration menus for that adapter.
Selecting the **Data Rate** option allows you to change the media employed by the Ethernet adapter:

```
10/10c ethernet TP PCI Adapter

1. Data Rate [Auto]
2. Full Duplex [Auto]

X-Exit
```

Selecting the **Full Duplex** option allows you to change how the Ethernet adapter communicates with the network:

```
DATA RATE
1. 10 Mbps
2. 100 Mbps
3. Auto

Full Duplex
1. Yes
2. No
3. Auto
```

Select **Ping**, from the Network Parameters Menu, to test a connection to a remote system unit. After selecting the Ping Option, you must choose which adapter communicates with the remote system.
After choosing which adapter to use to ping the remote system, you must provide the addresses needed to communicate with the remote system.

### Change SCSI ID
This option allows you to view and change the addresses of the SCSI controllers attached to your system unit.

### Update System or Service Processor Firmware
These options allow you to update your system or service processor firmware from an image on a 3.5 inch diskette. Note that you must insert a diskette containing the firmware update image after you see a confirmation screen.

To update system and service processor firmware, use Diagnostics Service Aid under AIX. To obtain firmware updates, as well as update instructions, see the following Web address: http://www.rs6000.ibm.com/support/micro.

If you are not able to obtain firmware updates or instructions from this Web address, contact your Service representative for assistance.
Only use the Firmware Update utility described here if instructed by an authorized representative or by instructions from the Web address posted above, or during the recovery of damaged firmware.

When you are prompted, insert the firmware update diskette containing the new firmware image.

**Attention:** While the new firmware image is being copied into your system unit, *do not* turn off the system unit. Turning off the system unit during the update process can render your system unit inoperable.

After the firmware update is complete, shut down and restart the system unit.

If the firmware update does not complete successfully or the system unit does not restart after the firmware update, contact your authorized reseller or marketing representative.

**Firmware Recovery**

For instructions on firmware recovery, go to “Firmware Recovery” on page 93.

**Select Console**

The Select Console Utility allows the user to select which console the user would like to use to display the SMS Menus. This selection is only for the SMS Menus and does not affect the display used by the AIX operating system.

Follow the instructions that display on the screen, select the console from the screen. Press 1 and the system will start the boot to AIX.

**Select Language**

This option allows you to change the language used by the text-based System Management Services screens.
To enter the Open Firmware command line, press the number 8 key after the keyboard text symbol displays during startup. If you have pressed the number 8 key, the Open Firmware command line (an OK prompt) displays after the initialization and power-on self tests (POST) are complete. The Open Firmware command line can be used to set up adapters that are not configurable with the System Management Services. Your adapter documentation directs you to use this option if it is needed.

**Note:** Your TTY must support the ISO-8859 character set to properly display languages other than English.

To enter the Open Firmware command line, you must press the F8 key after the keyboard icon displays during startup.

If you have pressed the F8 key, the Open Firmware command line (an OK prompt) displays after the initialization and power-on self test (POST) are complete.

**Note:** If you have installed a privileged-access password, you are prompted for this password before you gain access to the Open Firmware command line.

The Open Firmware command line can be used to set up adapters that are not configurable with the System Management Services. Your adapter documentation directs you to use this option if it is needed.
Chapter 5. Using the Standalone and Online Diagnostics

The diagnostics consist of Standalone Diagnostics and Online Diagnostics. Standalone Diagnostics are packaged on removable media and must be booted before they can be run. If booted, they have no access to the AIX error log or the AIX configuration data.

Online Diagnostics, when installed, reside with AIX on the disk or server. They can be run in any of the following ways:

- Booted in single user mode (called service mode)
- Run in maintenance mode (called maintenance mode)
- Concurrently (called concurrent mode) with other applications.

The online diagnostics have access to the AIX error log and the AIX configuration data.

Standalone and Online Diagnostics Operating Considerations

Consider the following before using the diagnostics:

- Run Online Diagnostics in Service Mode when possible, unless otherwise directed. The Online Diagnostics perform additional functions, compared to Standalone Diagnostics. This ensures that the error state of the system is captured in NVRAM for your use in fixing the problem. The AIX error log and certain SMIT functions are only available when diagnostics are run from the disk drive.
- When you run Online Diagnostics, device support for some devices might not have been installed. If this is the case, that device does not appear in the resource list.
- When you run Standalone Diagnostics, device support for some devices might be contained on supplemental diagnostic media. If this is the case, the device does not appear in the resource list when running diagnostics unless the supplemental media has been processed.
- Support for some TTY terminals is optionally installed. If you attach a TTY terminal to a system to run diagnostics, it might not work correctly because the AIX support for the terminal may not be installed.

Selecting a Console Display

When you run Standalone Diagnostics (and under some conditions Online Diagnostics), you must select the console display. The diagnostics display instructions on any graphics display and the terminal attached to the S1 serial port.

Identifying the Terminal Type to the Diagnostics Programs

Note: This is a different function from selecting a console display.

When you run diagnostics, you must identify what type of terminal you are using. If the terminal type is not known when the FUNCTION SELECTION menu is displayed, the diagnostics do not allow you to continue until a terminal is selected from the DEFINE TERMINAL option menu. Select lft for adapter-attached displays.
Undefined Terminal Types

If you specify an undefined terminal type from the DEFINE TERMINAL option menu, the menu prompts you to enter a valid terminal type. The menu redisplay until either a valid type is entered or the user exits the DEFINE TERMINAL option.

Resetting the Terminal

If you enter a terminal type that is valid (according to the DEFINE TERMINAL option menu) but is not the correct type for the ASCII terminal being used, you may be unable to read the screen, use the function keys, or use the Enter key. Bypass these difficulties by pressing Ctrl-C to reset the terminal. The screen display which results from this resetting action depends on the mode in which the system is being run:

- Online Normal or Maintenance Mode - The command prompt displays.
- Standalone Mode or Online Service Mode - The terminal type is reset to dumb, the Diagnostic Operating Instruction panel displays, and you are required to go through the DEFINE TERMINAL process again.

Running Standalone Diagnostics

Consider the following when you run Standalone Diagnostics:

- The diagnostic disc must remain in the CD-ROM drive for the entire time that the diagnostics are running.
- The diagnostic disc cannot be ejected from the CD-ROM drive after the diagnostic programs have loaded. The disc can only be ejected after the system has been turned off and then turned on (Standalone mode) or after the diagnostics program has terminated (Online concurrent mode). The disc must be ejected before the system attempts to load the diagnostic programs again.
- The CD-ROM drive from which diagnostics were loaded cannot be tested.
- The SCSI adapter (or circuitry) controlling the CD-ROM drive from which diagnostics were loaded cannot be tested.

Running Online Diagnostics

Consider the following when you run the Online Diagnostics from a server or a disk:

- The diagnostics cannot be loaded and run from a disk until the AIX operating system has been installed and configured. After the AIX operating system has been installed, all three modes of operation are available.
- The diagnostics cannot be loaded on a system (client) from a server if that system is not set up to IPL from a server over a network, or the server has not been set up to send a service mode IPL of the diagnostics. When the system is set up to IPL from a server, the diagnostics are run in the same manner as they are from disk.
- If the diagnostics were loaded from disk or a server, you must shut down the AIX operating system before turning off the system unit to prevent possible damage to disk data. This is done in one of two ways:
  - If the diagnostic programs were loaded in Stand-Alone mode, press the F3 key until DIAGNOSTIC OPERATING INSTRUCTIONS displays. Then follow the displayed instructions to shut down the AIX operating system.
  - If the diagnostic programs were loaded in maintenance or concurrent mode, enter the `shutdown -F` command.
Under some conditions the system may stop, with instructions displayed on attached displays and terminals. Follow the instructions to select a console display.

Running Diagnostics from a TTY Terminal

Consider the following when you run diagnostics using a TTY-type terminal as the console display:

- See the operator manual for your type of TTY terminal to find the key sequences you need to respond to the diagnostics. For the 3151, refer to the 3151 ASCII Display Station Guide to Operations, form number GA18-2633. For the 3164, refer to the 3164 ASCII Color Display Station Description, form number GA18-2617.
- When the diagnostics present display information through the S1 port, certain attributes are used. These attributes are set as if the diagnostics were using a 3161 display terminal. Refer to the tables in "Appendix D. General Attributes Required When Using a TTY Terminal" on page 167 for a list of attributes for the 3161 ASCII Display Terminal and for two other ASCII display terminals commonly used with the system.
- If you have a TTY terminal other than a 3151, 3161, or 3164 attached to the S1 port, your terminal may have different names for the attributes. Refer to the tables in "Appendix D. General Attributes Required When Using a TTY Terminal" on page 167. Use the attribute descriptions listed there to determine the settings for your terminal.

Online Diagnostics Modes

The Online diagnostics can be run in three modes:

- Service Mode allows checking of most system resources.
- Concurrent Mode allows the normal system functions to continue while selected resources are being checked.
- Maintenance Mode allows checking of most system resources.

Service Mode

Service mode provides the most complete checkout of the system resources. This mode also requires that no other programs be running on the system. All system resources except the SCSI adapter and the disk drives used for paging can be tested. However, note that system memory and the processor are only tested during POST.

Error log analysis is done in service mode when you select the Problem Determination option on the DIAGNOSTIC MODE SELECTION menu.

To run Online diagnostics in service mode, use the following steps:

1. Stop all programs, including the AIX operating system.
2. Remove all tapes, diskettes, and CD-ROM discs.
3. Turn off the system unit's power.
4. Turn on the system unit's power.
5. After the first POST indicator displays on the system unit's console, press F6 on the directly attached keyboard or 6 on the TTY keyboard to indicate that diagnostics are to be loaded.
Note: The term POST indicator refers to the Icons (graphic display) or device mnemonics (ASCII terminal) that are displayed while the POST is executing.

6. Enter any requested password.
7. Follow any instructions to select a console.
8. After the diagnostic controller loads, DIAGNOSTIC OPERATING INSTRUCTIONS appear on the console display.
9. Follow the displayed instructions to check out the desired resources.
10. When testing is complete, use the F3 key to return to the DIAGNOSTIC OPERATING INSTRUCTIONS.
11. Press the F3 key (from a defined terminal) or press 99 (for an undefined terminal) to shut down the diagnostics before turning off the system unit.

Note: Pressing the F3 key (from a defined terminal) produces a Confirm Exit menu containing two options:
- Continue with the shutdown by pressing F3.
- Return to diagnostics by pressing Enter.

For undefined terminals, pressing 99 produces a menu containing two options:
- Continue with the shutdown by pressing 99, then Enter
- Return to diagnostics by pressing Enter.

Concurrent Mode

Concurrent mode provides a way to run Online diagnostics on some of the system resources while the system is running normal activity.

Because the system is running in normal operation, some of the resources cannot be tested. The following resources cannot be tested in concurrent mode:
- SCSI adapters connected to paging devices
- Disk drive used for paging
- Any graphics-related device if running X, CDE, or windowing environment.
- Memory
- Processor

Three levels of testing are available in concurrent mode:
- The share-test level tests a resource while the resource is being shared by programs running in the normal operation. This testing is mostly limited to normal commands that test for the presence of a device or adapter.
- The sub-test level tests a portion of a resource while the remaining part of the resource is being used in normal operation. For example, this test could test one port of a multiport device while the other ports are being used in normal operation.
- The full-test level requires the device not be assigned to or used by any other operation. This level of testing on a disk drive might require the use of the varyoff command. The diagnostics display menus allow you to vary off the needed resource.
Error-log analysis is done in concurrent mode when you select the **Problem Determination** option on the DIAGNOSTIC MODE SELECTION menu.

To run the Online diagnostics in concurrent mode, you must be logged in to the AIX operating system and have the appropriate proper authority to issue the commands.

The `diag` command loads the diagnostic controller and displays the Online diagnostic menus.

**Running the Online Diagnostics in Concurrent Mode**

To run Online diagnostics in concurrent mode, use the following steps:

1. Log in to the AIX operating system as root user.
2. Enter the `diag` command.
3. When the DIAGNOSTIC OPERATING INSTRUCTIONS displays, follow the instructions to check out the desired resources.
4. When testing is complete, use the F3 key to return to the DIAGNOSTIC OPERATING INSTRUCTIONS. Then press the F3 key again to return to the AIX operating system prompt. Be sure to vary on any resource you had varied to off.
5. Press the Ctrl-D key sequence to log off from root user.

**Maintenance Mode**

Maintenance mode runs the Online diagnostics using the customer’s version of the AIX operating system. This mode requires that all activity on the AIX operating system be stopped so the Online diagnostics have most of the resources available to check. All of the system resources except the SCSI adapters, memory, processor, and the disk drive used for paging can be checked.

Error-log analysis is done in maintenance mode when you select the Problem Determination option on the DIAGNOSTIC MODE SELECTION menu.

The `shutdown -m` command is used to stop all activity on the AIX operating system and put the AIX operating system into maintenance mode. The `diag` command is used to invoke the diagnostic controller so you can run the diagnostics. After the diagnostic controller is then loaded, follow the normal diagnostic instructions.

**Running the Online Diagnostics in Maintenance Mode**

To run the Online diagnostics in maintenance mode, you must be logged in to the customer’s version of the AIX operating system as root user and use the `shutdown -m` and `diag` commands. Use the following steps to run the Online diagnostics in maintenance mode:

1. Stop all programs except the AIX operating system.
2. Log in to the AIX operating system as root user.
3. Enter the `shutdown -m` command.
4. When a message indicates system is in single-user mode, enter the `diag` command.

**Note:** It may be necessary to set `TERM` type again.
5. When DIAGNOSTIC OPERATING INSTRUCTIONS is displayed, follow the displayed instructions to check out the desired resources.

6. When testing is complete, use the F3 key to return to DIAGNOSTIC OPERATING INSTRUCTIONS. Then press the F3 key again to return to the AIX operating system prompt.

7. Press Ctrl-D to log off from root user.

**Standalone Diagnostic Operation**

Standalone Diagnostics provide a method to test the system when the Online Diagnostics are not installed and as a method of testing the disk drives and other resources that cannot be tested by the Online Diagnostics.

No Error Log Analysis is done by the Stand-Alone Diagnostics.

If running from CD-ROM, the CD-ROM drive and the SCSI controller that controls it cannot be tested by the Standalone Diagnostics.

**Running the Standalone Diagnostics**

To run Standalone Diagnostics in service mode, use the following steps:

1. Stop all programs, including the AIX operating system.
2. Remove all tapes, diskettes, and CD-ROMs.
3. Turn off the system unit’s power.
4. Set the key mode switch to the service position.
5. Turn on the system unit’s power.
6. Insert the diagnostic media drive.
7. When the keyboard POST indicator displays, press the F5 key on the directly attached keyboard, or the number 5 key on the TTY keyboard.
8. Enter any requested passwords.
9. Follow any instruction to select the console.
10. After the diagnostic controller loads, DIAGNOSTIC OPERATING INSTRUCTIONS appear on the console display.
11. Follow the displayed instructions to check out the desired resources.
12. When testing is complete, use the F3 key to return to the DIAGNOSTIC OPERATING INSTRUCTIONS.
Chapter 6. Introducing Tasks and Service Aids

The AIX Diagnostic Package contains programs that are called Tasks. Tasks can be thought of as performing a specific function on a resource; for example, running diagnostics or performing a service aid on a resource. This chapter describes the tasks available in AIX Diagnostics Version 4.2 and later.

Note: Many of these programs work on all system model architectures. Some programs are only accessible from online diagnostics in service or concurrent mode, while others may be accessible only from Standalone Diagnostics. Still other programs may only be supported on a particular system architecture, such as CHRP (Common Hardware Reference Platform), or RSPC (PowerPC Reference Platform). The 7044 Model 170 is a CHRP architecture system.

Use the FUNCTION SELECTION menu to perform tasks.

After a task is selected, a resource menu may be presented showing all resources supported by the task.

You can use a fast path method to perform a task by using the diag command and the -T flag. The fast-path tasks are as follows:

- Certify – certifies media
- Chkspares – checks for the availability of spare sectors
- Download – downloads microcode to an adapter or device
- Disp_mcode – displays current level of microcode
- Format – formats media
- Identify – identifies the PCI RAID physical disks

To run these tasks directly from the command line, specify the resource and other task-unique flags. Use the descriptions in this chapter to understand which flags are needed for a given task.

Tasks

The following tasks are described in this chapter:

- Add Resource to Resource List
- AIX Shell Prompt
- Analyze Adapter Internal Log
- Backup and Restore Media
- Certify Media
- Change Hardware Vital Product Data
- Configure Dials and LPFKeys
- Configure ISA Adapters
- Configure Reboot Policy
- Configure Remote Maintenance Policy
- Configure Ring Indicate Power On
- Configure Ring Indicate Power On Policy
- Configure Service Processor
Add Resource to Resource List

Use this task to add resources back to the resource list.

- Configure Surveillance Policy
- Create Customized Configuration Diskette
- Delete Resource from Resource List
- Disk Maintenance
- Display Configuration and Resource List
- Display Firmware Device Node Information
- Display Hardware Error Report
- Display Hardware Vital Product Data
- Display Machine Check Error Log
- Display Microcode Level
- Display or Change Bootlist
- Display or Change Diagnostic Run Time Options
- Display Previous Diagnostic Results
- Display Resource Attributes
- Display Service Hints
- Display Software Product Data
- Display System Environmental Sensors
- Display Test Patterns
- Download Microcode
- Fibre Channel RAID Service Aids
- Flash SK-NET FDDI Firmware
- Format Media
- Generic Microcode Download
- Local Area Network Analyzer
- Log Repair Action
- Periodic Diagnostics
- PCI RAID Physical Disk Identify
- Process Supplemental Media
- Run Diagnostics
- Run Error Log Analysis
- Run Exercisers
- Save or Restore Hardware Management Policies
- Save or Restore Service Processor Configuration
- SCSI Bus Analyzer
- SCSI Device Identification and Removal
- SCSD Tape Drive Service Aid
- Spare Sector Availability
- SSA Service Aid
- Update Disk Based Diagnostics
- Update System or Service Processor Flash
- Update System Flash
- 7135 RAIDiant Array Service Aids
- 7318 Serial Communication Network Server
Note: Only resources that were previously detected by the diagnostics and deleted from the Diagnostic Test List are listed. If no resources are available to be added, then none are listed.

AIX Shell Prompt

Note: Use this Service Aid in Online Service Mode only.

This service aid allows access to the AIX command line. To use this service aid, the user must know the root password (when a root password has been established).

Note: Do not use this task to install code or to change the configuration of the system. This task is intended to view files, configuration records, and data. Using this service aid to change the system configuration or install code might result in unexplained system problems after exiting the diagnostics.

Analyze Adapter Internal Log

The PCI RAID adapter has an internal log that logs information about the adapter and the disk drives attached to the adapter. Whenever data is logged in the internal log, the device driver copies the entries to the AIX system error log and clears the internal log.

The Analyze Adapter Internal Log service aid analyzes these entries in the AIX system error log. The service aid displays the errors and the associated service actions. Entries that do not require any service actions are ignored.

Backup and Restore Media

This service aid allows verification of backup media and devices. It presents a menu of tape and diskette devices available for testing and prompts for selecting the desired device. It then presents a menu of available backup formats and prompts for the desired format. The supported formats are tar, backup, and cpio. After the device and format are selected, the service aid backs up a known file to the selected device, restores that file to /tmp, and compares the original file to the restored file. The restored file remains in /tmp to allow for visual comparison. All errors are reported.

Certify Media

This task allows the selection of diskette or hardfiles to be certified.

Hardfiles can be connected either to a SCSI adapter (non-RAID) or a PCI SCSI RAID adapter. The usage and criteria for a hardfile connected to a non-RAID SCSI adapter are different from those for a hardfile connected to a PCI SCSI RAID adapter.

- Certify Diskette
  This selection enables you to verify the data written on a diskette. You can select the type of diskette being verified. The program then reads all of the ID and data fields on the diskette one time and displays the total number of bad sectors found.
• Certify Hardfile Attached to a Non-RAID SCSI Adapter
  
  This selection reads all of the ID and data fields. It checks for bad data and counts all errors encountered. If the unrecovered data errors exceed the threshold value, the hardfile needs to be formatted and certified. If the recovered data errors, recovered (and unrecovered) equipment errors exceed the threshold values, the disk needs to be replaced.

  This task can be run directly from the AIX command line. The syntax of the command is as follows:
  
  `diag -c -d deviceName -T "certify"`

• Certify Hardfile attached to a PCI SCSI RAID Adapter
  
  This selection is used to certify physical disks attached to a PCI SCSI RAID adapter. Certify reads the entire disk and checks for recovered errors, unrecovered errors, and reassigned errors. If these errors exceed the threshold values, the user is prompted to replace the physical disk.

  This task can be run directly from the AIX command line. The syntax of the command is as follows:
  
  `diag -c -d < RAID adapterName -T "certify {-l chID | -A}"`

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>

<tr>
<td>-l</td>
<td>Physical Disk channel/ID (for example: 27)</td>
</tr>
<tr>
<td>-A</td>
<td>All disks</td>
</tr>
</tbody>
</table>

---

### Change Hardware Vital Product Data

Use this service aid to display the Display/Alter VPD Selection Menu. The menu lists all resources installed on the system. When a resource is selected, a menu displays that lists all the VPD for that resource.

**Note:** The user cannot alter the VPD for a specific resource unless it is not machine readable.

### Configure Dials and LPFKKeys

This service aid provides a tool for configuring and removing dials/LPFKs (Lighted Program Function Keys) to the asynchronous serial ports.

A TTY must be defined on the async port before the Dials and LPFKs can be configured on the port. Prior to AIX Version 4.2, the Dials and LPFKs could only be configured on the standard serial ports. For AIX Version 4.2 and later, the Dials and LPFKs can be configured on any async port.

This selection invokes the SMIT utility to allow Dials and LPFKs configuration. A TTY must be in the available state on the async port before the Dials and LPFKs can be configured on the port. The task allows an async adapter to be configured, then a TTY port defined on the adapter, and then Dials and LPFKs can be defined on the port.
Configure ISA Adapter

This task uses SMIT to allow the identification and configuration of ISA adapters on systems that have an ISA bus and adapters.

Diagnostic support for ISA adapters not shown in the list may be supported from a supplemental diskette. You can use the Process Supplemental Media task to add ISA adapter support from a supplemental diskette.

Whenever an ISA adapter is installed, this service aid must be run and the adapter configured before the adapter can be tested. You must also run this service aid to remove an ISA adapter from the system whenever an ISA adapter is physically removed from the system.

If diagnostics are run on an ISA adapter that has been removed from the system, the diagnostics fail because the system cannot detect the ISA adapter.

Configure Reboot Policy

This service aid controls how the system tries to recover from a system crash. Use this service aid to display and change the following settings for the Reboot Policy.

Note: Some of the following settings may not be displayed by this service aid.

- Maximum Number of Reboot Attempts
  Enter a number that is 0 or greater.

  Note: A value of 0 indicates 'do not attempt to reboot' to a crashed system.

  This number is the maximum number of consecutive attempts to reboot the system. The term reboot, in the context of this service aid, is used to describe bringing system hardware back up from scratch, for example from a system reset or power on.

  When the reboot process completes successfully, the reboot attempts count is reset to 0, and a restart begins. The term restart, in the context of this service aid, is used to describe the operating system activation process. Restart always follows a successful reboot.

  When a restart fails, and a restart policy is enabled, the system attempts to reboot for the maximum number of attempts.

  - Use the O/S Defined Restart Policy (1=Yes, 0=No)
    When 'Use the O/S Defined Restart Policy’ is set to Yes, the system attempts to reboot from a crash if the operating system has an enabled Defined Restart or Reboot Policy.
    When 'Use the O/S Defined Restart Policy’ is set to No, or the operating system restart policy is undefined, then the restart policy is determined by the ‘Supplemental Restart Policy’.

  - Enable Supplemental Restart Policy (1=Yes, 0=No)
The 'Supplemental Restart Policy', if enabled, is used when the O/S Defined Restart Policy is undefined, or is set to False.

When surveillance detects operating system inactivity during restart, an enabled 'Supplemental Restart Policy' causes a system reset and the reboot process begins.

- **Call-Out Before Restart (on/off)**
  When enabled, Call-Out Before Restart allows the system to call out (on a serial port that is enabled for call out) when an operating system restart is initiated. Such calls can be valuable if the number of these events becomes excessive, thus signalling bigger problems.

- **Enable Unattended Start Mode (1=Yes, 0=No)**
  When enabled, 'Unattended Start Mode' allows the system to recover from the loss of ac power.
  
  If the system was powered on when the ac loss occurred, the system reboots when power is restored. If the system was powered off when the ac loss occurred, the system remains off when power is restored.

You can access this service aid directly from the AIX command line by typing:
```
/usr/lpp/diagnostics/bin/uspchrp -b
```

### Configure Remote Maintenance Policy

The Remote Maintenance Policy includes modem configurations and phone numbers to use for remote maintenance support. Use this service aid to display and change the following settings for the Remote Maintenance Policy.

**Note:** Some of the following settings may not be displayed by this service aid.
- **Configuration File for Modem on S1**
  Configuration File for Modem on S2
  Enter the name of a modem configuration file to load on either serial port 1 (S1) or serial port 2 (S2). The modem configuration files are located in the directory `/usr/share/modems`. If a modem file is already loaded, a 'Modem file currently loaded' message displays.
  - **Modem file currently loaded on S1**
    Modem file currently loaded on S2
    This is the name of the file that is currently loaded on serial port 1 or serial port 2.

**Note:** These settings are only shown when a modem file is loaded for a serial port.
- **Call In Authorized on S1** (on/off)
  Call In Authorized on S2 (on/off)
  Call In allows the Service Processor to receive a call from a remote terminal.
- **Call Out Authorized on S1** (on/off)
  Call Out Authorized on S2 (on/off)
  Call Out allows the Service Processor to place calls for maintenance.
- **S1 Line Speed**
  S2 Line Speed
  A list of line speeds is available by using 'List' on the screen.
- **Service Center Phone Number**
  Telephone number of the service center computer. The service center usually includes a computer that takes calls from systems with call-out capability. This
computer is referred to as the catcher. The catcher expects messages in a specific format to which the Service Processor conforms. For more information about the format and catcher computers, refer to the README file in the AIX /usr/samples/syscatch directory. Contact the service provider for the correct telephone number to enter here.

• Customer Administration Center Phone Number
  Telephone number of the System Administration Center computer (catcher) that receives problem calls from systems. Contact the system administrator for the correct telephone number to enter here.

• Digital Pager Phone Number In Event of Emergency
  Number for a pager carried by someone who responds to problem calls from your system.

• Customer Voice Phone Number
  Telephone number for a telephone near the system, or answered by someone responsible for the system. This is the telephone number left on the pager for callback.

• Customer System Phone Number
  Telephone number to which your system’s modem is connected. The service or administration center representatives need this number to make direct contact with your system for problem investigation. This is also referred to as the Call-in phone number.

• Customer Account Number
  This number is available for service providers to use for record keeping and billing.

• Call Out Policy-Numbers to call if failure
  This is set to either first or all. If the call-out policy is set to first, call out stops at the first successful call to one of the following numbers in the order listed:
  1. Service Center
  2. Customer Administration Center
  3. Pager

  If Call Out Policy is set to all, call-out attempts to call all of the following numbers in the order listed:
  1. Service Center
  2. Customer Administration Center
  3. Pager

• Customer RETAIN Login ID Customer RETAIN Login Password
  These settings apply to the RETAIN service function.

• Remote Timeout, in seconds Remote Latency, in seconds
  These settings are functions of the service provider’s catcher computer.

• Number of Retries While Busy
  This is the number of times the system should retry calls that resulted in busy signals.

• System Name (System Administrator Aid)
  Name given to the system and is used when reporting problem messages.
Note: If you provide the system name, your support team can quickly identify the location, configuration, and history of your system.

You can access this service aid directly from the AIX command line by typing:
/usr/lpp/diagnostics/bin/uspcchrp -m

Configure Ring Indicate Power On Policy

Note: This service aid runs on CHRP system units only.

This service aid allows the user to power-on a system by telephone from a remote location. If the system is powered off, and Ring Indicate Power On is enabled, the system powers on at a predetermined number of rings. If the system is already on, no action is taken. In either case, the telephone call is not answered, and the caller receives no feedback that the system has powered on.

Use this service aid to display and change the following settings for the Ring Indicate Power On Policy.

Note: Some of the following settings may not be displayed by this service aid.
- Power On Via Ring Indicate (on/off)
- Number of Rings until Power On

You can access this service aid directly from the AIX command line by typing:
/usr/lpp/diagnostics/bin/uspcchrp -r

Configure Ring Indicate Power On

Note: This service aid runs on RSPC system units only.

This service aid allows the user to display and change the NVRAM settings for the Ring Indicate Power On capability of the service processor.

The settings allows the user to:
- Enable or Disable power on from Ring Indicate
- Read or Set the number of rings before power on

Configure Service Processor

Note: This service aid runs on RSPC system units only.

This service aid allows you to display and change the NVRAM settings for the service processor.

This service aid supports the following functions:
• Surveillance Setup
• Modem Configuration
• Call In/Call Out Setup
• Site-Specific Call In/Call Out Setup
• Reboot/Restart Policy Setup

**Surveillance Setup**

This selection allows you to display and change the NVRAM settings for the surveillance capability of the service processor.

The settings allow you to:
- Enable or disable surveillance
- Set the surveillance time interval, in minutes
- Set the surveillance delay, in minutes

The current settings are read from NVRAM (Nonvolatile Random Access Memory) and displayed on the screen. Any changes made to the data shown are written to NVRAM.

**Modem Configuration**

Use this selection when setting the NVRAM for a modem attached to any of the Service Processor’s serial ports. The user inputs the file name of the modem configuration file and the serial port number the formatted modem configuration file is read, converted for NVRAM, and then loaded into NVRAM. Refer to the Service Processor Installation and User’s Guide for more information.

**Call In/Out Setup**

This selection allows the user to display and change the NVRAM settings for the Call In/Call Out capability of the service processor.

The settings allows the user to:
- Enable or Disable call in on either serial port
- Enable or Disable call out on either serial port
- Set the line speed on either serial port

**Site-Specific Call In/Out Setup**

This selection allows you to display and change the NVRAM settings that are site-specific for the call in/call out capability of the service processor.

The site-specific NVRAM settings allow you to set the following:
- Phone number for the service center
- Phone number for the customer administration center
- Phone number for a digital pager
- Phone number for the customer system to call in
- Phone number for the customer voice phone
- Customer account number
- Call out policy
- Customer RETAIN id
- Customer RETAIN password
- Remote timeout value
- Remote latency value
- Number of retries while busy
- System name

The current settings are read from VRAM (Video Random Access Memory) and displayed on the screen. Any changes made to the data shown are written to NVRAM.

Reboot/Restart Policy Setup

This selection controls how the system tries to recover from a system crash.

Use this service aid to display and change the following settings for the following:
- Boot Policy Setup.
- Minimum Number of Reboot Attempts
- Enter a number that is 0 or greater.

Note: A value of 0 indicates “do not attempt to reboot” to a crashed system.

This number is the maximum number of consecutive attempts allowed to reboot the system. The term reboot, when used in context of this service aid, describes the system hardware being brought back up. Examples would be a system reset or turning on the power on.

When the maximum number of reboot attempts is exceeded, the system calls out if that function has been enabled.

When the reboot process completes successfully, the reboot-attempts count is reset to 0, and a restart begins. The term restart, when used in context of this service aid, describes the operating system activation process. Restart always follows a successful reboot.

When a restart fails, and a restart policy is enabled, the system attempts to reboot for the maximum number of reboot attempts.

- Enable Restart Policy (1=Yes, 0=No)
  When the service processor detects operating system inactivity, an enabled “Restart Policy” causes a system reset, and the reboot process begins.

- Call-Out Before Restart (on/off)
  When enabled, “Call-Out Before Restart” allows the system to call out (on a serial port that is enabled for call out) when an operating system restart is initiated. Such call-outs can be valuable if the number becomes excessive, which signals bigger problems.

- Enable Unattended Start Mode (1=Yes, 0=No)
  When enabled, “Unattended Start Mode” allows the system to recover from the loss of ac power.
If the system was powered on when the ac loss occurred, the system reboots when power is restored. If the system was powered off when the ac loss occurred, the system remains off when power is restored.

Configure Surveillance Policy

This service aid monitors the system for hang conditions; that is, hardware or software failures that cause operating system inactivity. When enabled, and surveillance detects operating system inactivity, a call is placed to report the failure.

Use this service aid to display and change the following settings for the Surveillance Policy.

**Note:** Some of the following settings may not be displayed by this service aid.

- Surveillance
- Surveillance Time Interval, in minutes
  Maximum time between heartbeats from the operating system.
- Surveillance Delay, in minutes
  Time to delay between when the operating system is in control and when to begin operating system surveillance.
- Changes are to take effect immediately
  Set this to yes if the changes made to the settings in this menu are to take place immediately. Otherwise, the changes take effect beginning with the next system boot.

You can access this service aid directly from the AIX command line by entering:

```
/usr/lpp/diagnostics/bin/uspchrp -s
```

Create Customized Configuration Diskette

This selection invokes the Diagnostic Package Utility Service Aid, which allows the user to create a stand-alone diagnostic package configuration diskette.

The Stand-Alone Diagnostic Package Configuration Diskette allows the following to be changed from the console:

- Default refresh rate for a LFT (Limited Function Terminal)
  The refresh rate used by the stand-alone diagnostic package is 60Hz. If the display’s refresh rate is 77Hz, set the refresh rate to 77.
- Different async terminal console
  Use this service aid to create a console configuration file that allows a terminal attached to any RS232 or RS422 adapter to be selected as a console device. The default device is RS232 TTY attached to the first standard serial port (S1).

Delete Resource from Resource List

Use this task to delete resources from the resource list.
Note: Only resources that were previously detected by the diagnostics and have not been deleted from the Diagnostic Test List are listed. If no resources are available to be deleted, then none are listed.

Disk Maintenance

- Disk to Disk Copy
- Display/Alter Sector

Disk to Disk Copy

Notes:
1. This service aid cannot be used to update to a different size drive. The service aid only supports copying from a SCSI drive to another SCSI drive of similar size.
2. Use the `migratepv` command when copying the contents to other disk drive types. This command also works when copying SCSI disk drives or when copying to a different size SCSI disk drive. Refer to System Management Guide: Operating System and Devices for a procedure on migrating the contents of a physical volume.

This selection allows you to recover data from an old drive when replacing it with a new drive. The service aid recovers all LVM (Logical Volume Manager) software reassigned blocks. To prevent corrupted data from being copied to the new drive, the service aid aborts if an unrecoverable read error is detected. To help prevent possible problems with the new drive, the service aid aborts if the number of bad blocks being reassigned reaches a threshold.

This service aid requires that both the old and new disks be installed in or attached to the system with unique SCSI addresses. This requires that the new disk drive SCSI address must be set to an address that is not currently in use and the drive be installed in an empty location. If there are no empty locations, then one of the other drives must be removed. Once the copy is complete, only one drive may remain installed. Either remove the target drive to return to the original configuration, or use the following steps to complete the replacement of the old drive with the new drive.
1. Remove both drives.
2. Set the SCSI address of the new drive to the SCSI address of the old drive.
3. Install the new drive in the old drive’s location.
4. Install any other drives that were removed into their original location.

To prevent problems that can occur when running this service aid from disk, it is suggested that when possible this service aid be run from the diagnostics that are loaded from removable media.
Display/Alter Sector

This selection allows the user to display and alter information on a disk sector. Use this service aid carefully, because inappropriate modification to some disk sectors may result in total loss of all data on the disk. Sectors are addressed by their decimal sector number. Data is displayed both in hex and in ASCII. To prevent corrupted data from being incorrectly corrected, the service aid does not display information that cannot be read correctly.

Display Configuration and Resource List

This service aid displays only the item header for all installed resources. Use this service aid when there is no need to see the VPD (vital product data).

Display Firmware Device Node Information

This task displays the firmware device node information that appears on CHRP platforms. The format of the output data may not be the same among different levels of AIX. It is intended to gather more information about individual or particular devices on the system.

Display Hardware Error Report

This service aid uses the `errpt` command to provide a tool for viewing the hardware error log.

The Display Error Summary and Display Error Detail selections provide the same type of report as the `errpt` command.

Display Hardware Vital Product Data

This service aid displays all installed resources, along with any VPD (Vital Product Data) for those resources. Use this service aid when you want to look at the VPD for a specific resource.

Display Machine Check Error Log

**Note:** The Machine Check Error Log Service Aid is available only on Stand-Alone Diagnostics.

When a machine check occurs, information is collected and logged in an NVRAM error log before the system unit shuts down. This information is logged in the AIX error log and cleared from NVRAM when the system is rebooted from the hard disk, LAN, or stand-alone media. When booting from Stand-Alone Diagnostics, this service aid can convert the logged information into a readable format that can help to isolate the problem. When booting from the hard disk or LAN, the information can be viewed from
the AIX error log, using the Hardware Error Report Service Aid. In either case, the
information is analyzed when running the sysplanar0 diagnostics in Problem
Determination Mode.

### Display Microcode Level

Use this task to display the current level of microcode on an adapter or device. The
syntax of the command is as follows: `diag -c -d device_name -T "disp_mcode"

### Display or Change Bootlist

This service aid allows the bootlist to be displayed, altered, or erased.

The system attempts to perform an IPL from the first device in the list. If the device is
not a valid IPL device or if the IPL fails, the system proceeds in turn to the other listed
devices to attempt an IPL.

### Display or Change Diagnostic Run-Time Options

The Display or Change Diagnostic Run-Time Options task allows the diagnostic
run-time options to be set.

**Note:** The run-time options are used only when selecting the Run Diagnostic task.

The run-time options are:

- **Display Diagnostic Mode Selection Menus**
  This option allows the user to enable displaying THE DIAGNOSTIC MODE
  SELECTION MNU (the default is off).

- **Run Tests Multiple Times**
  This option allows the user to enable running the diagnostic in loop mode (the default
  is off).

  **Note:** This option is only displayed when you run Online Diagnostics in Service
  Mode.

- **Include Advanced Diagnostics**
  This option allows the user to enable including the Advanced Diagnostics (the default
  is off).

- **Include Error Log Analysis**
  This option allows the user to enable including the Error Log Analysis (ELA) (the
default is off).

- **Number of Days Used to Search Error Log**
  This option allows the user to select the number of days to search the AIX error log
  for errors when running the Error Log Analysis. The default is 7 days, but it can be
  changed from 1 to 60 days.

- **Display Progress Indicators**
This option allows the user to enable the progress indicators when running the Diagnostic Applications. The progress indicators display at the bottom of the screen, which indicate that the test being run (the default is on).

- Diagnostic Event Logging
  This option allows the user to enable logging information to the Diagnostic Event Log (the default is on).

- Diagnostic Event Log File Size
  This option allows the user to select the maximum size of the Diagnostic Event Log. The default size for the Diagnostic Event Log is 100 KB. The size can be increased in 100 KB increments to a maximum of 1 MB.

## Display Previous Diagnostic Results

**Note:** This service aid is not available when you load the diagnostics from a source other than a hard disk drive or a network.

This service aid allows a service representative to display result from a previous diagnostic session. When the Display Previous Diagnostic Results option is selected, the user can view up to 25 no trouble found (NTF) and service request number (SRN) results.

This service aid displays Diagnostic Event Log information, which can be displayed in either short or long version. The information is displayed in reverse chronological order.

This information is not from the AIX operating system error log. This information is stored in the `/var/adm/ras` directory.

You can run the command from the AIX command line by typing:

```bash
/usr/lpp/diagnostics/bin/diagrpt [-o] [-s mmmddyy mmmddyy] [-a] [-r]
```

**Flag** | **Description**
---|---
-o | Displays the last diagnostic results file stored in the `/etc/lpp/diagnostics/data` directory
-s mmmddyy | Displays all diagnostic result files logged since the date specified
-a | Displays the long version of the Diagnostic Event Log
-r | Displays the short version of the Diagnostic Event Log

## Display Resource Attributes

This task displays the Customized Device Attributes associated with a selected resource. This task is similar to running the `lsattr -E -I resource` command.
Display Service Hints

This service aid reads and displays the information in the CEREADME file from the diagnostics media. This file contains information that is not in the publications for this version of the diagnostics. The file also contains information about using this particular version of diagnostics.

Display Software Product Data

This task uses SMIT to display information about the installed software and provides the following functions:
- List Installed Software
- List Applied but Not Committed Software Updates
- Show Software Installation History
- Show Fix (APAR) Installation Status
- List Fileset Requisites
- List Fileset Dependents
- List Files Included in a Fileset
- List Fileset containing file

Display System Environmental Sensors

This service aid displays the environmental sensors implemented on a CHRP system. The information displayed is the sensor name, physical location code, literal value of the sensor status, and the literal value of the sensor reading.

The sensor status can be any one of the following:
- **Normal** – The sensor reading is within the normal operating range.
- **Critical High** – The sensor reading indicates a serious problem with the device. Run diagnostics on sysplanar0 to determine what repair action is needed.
- **Critical Low** – The sensor reading indicates a serious problem with the device. Run diagnostics on sysplanar0 to determine what repair action is needed.
- **Hardware Busy** – The system has repeatedly returned a busy indication, and a reading is not available. Try the service aid again. If the problem continues, run diagnostics on sysplanar0 in problem determination mode to determine what repair action is needed.
- **Hardware Error** - The sensor could not be read because of a hardware error. Run diagnostics on sysplanar0 in problem determination mode to determine what repair action is needed.
- **Warning High** – The sensor reading indicates a problem with the device. This could become a critical problem if action is not taken. Run diagnostics on sysplanar0 to determine what repair action is needed.
- **Warning Low** – The sensor reading indicates a problem with the device. This could become a critical problem if action is not taken. Run diagnostics on sysplanar0 to determine what repair action is needed.
This service aid can also be run as a command. Use the command to list the sensors and their values in a text format, list the sensors and their values in numerical format, or a specific sensor can be queried to return either the sensor status or sensor value.

Run the command by entering one of the following:

**Note:** These commands work only when the flags are entered one at a time (such as those shown in Examples 1 and 2)

```
/usr/lpp/diagnostics/bin/uesensor -l | -a /usr/lpp/diagnostics/bin/uesensor -t token -i index [-v]
```

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-l</td>
<td>List the sensors and their values in a text format.</td>
</tr>
<tr>
<td>-a</td>
<td>List the sensors and their values in a numerical format. For each sensor, the following numerical values are displayed as:</td>
</tr>
<tr>
<td></td>
<td><code>token index status measuredvalue location code</code></td>
</tr>
<tr>
<td>-t</td>
<td>Specifies the sensor token to query.</td>
</tr>
<tr>
<td>-i</td>
<td>Specifies the sensor index to query.</td>
</tr>
<tr>
<td>-v</td>
<td>Indicates to return the sensor measured value. The sensor status is returned by default.</td>
</tr>
</tbody>
</table>

**Examples**

1. Display a list of the environmental sensors:

   `/usr/lpp/diagnostics/bin/uesensor -l`

   This is the results of running the example command only.

   `Sensor = Fan Speed Status = Normal Value = 2436 RPM Location Code = F1`

   `Sensor = Power Supply Status = Normal Value = Present and operational Location Code = V1`

   `Sensor = Power Supply Status = Critical low Value = Present and not operational Location Code = V2`

2. Display a list of the environmental sensors in a numerical list:

   `/usr/lpp/diagnostics/bin/uesensor -a`

   This is the result of running the example command only.

   `3 0 11 87 P1 9001 0 11 2345 F1 9004 0 11 2 V1 9004 1 9 2 V2`

3. Return the status of sensor 9004, index 1:

   `/usr/lpp/diagnostics/bin/uesensor -t 9004 -i 1`

   This is the result of running the example command only.

4. Return the value of sensor 9004, index 1:
Display Test Patterns

This service aid provides a means of adjusting system display units by providing displayable test patterns. You can select the display type and test pattern. After you make the selections, the test pattern displays.

Download Microcode

This service aid provides a way to copy microcode to an adapter or device. The service aid presents a list of adapters and devices that use microcode. After the adapter or device is selected, you can check the current level and download the needed microcode.

This task can be run directly from the AIX command line. The following sections guide you for a particular type of adapter or device.

Download Microcode to PCI SCSI RAID Adapter

The syntax of the command for a PCI SCSI RAID Adapter is as follows:

```
diag -c -d RAID adapterName -T "download [-B] [-D] [-P]"
```

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-B</td>
<td>Download boot block microcode (default to functional microcode).</td>
</tr>
<tr>
<td>-D</td>
<td>Microcode is on diskette (default to /etc/microcode directory).</td>
</tr>
<tr>
<td>-P</td>
<td>Download the previous level of microcode (default to latest level).</td>
</tr>
</tbody>
</table>

Download Microcode to Disk Drive Attached to a PCI SCSI RAID Adapter

The syntax of the command for a disk drive attached to a PCI RAID Adapter is as follows:

```
diag -c -d RAID adapterName -T "download {-l chID | -A} [-D] [-P]"
```

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-A</td>
<td>All disk drives.</td>
</tr>
<tr>
<td>-D</td>
<td>Microcode is on diskette (default to /etc/microcode directory).</td>
</tr>
<tr>
<td>-l</td>
<td>RAID disk drive-physical disk channel/ID (for example 27).</td>
</tr>
<tr>
<td>-P</td>
<td>Download the previous level of microcode (default to latest level).</td>
</tr>
</tbody>
</table>

Download Microcode to a PCI FC-AL Adapter

The syntax of the command for a PCI FC-AL Adapter is as follows:

```
diag -c -d device_name -T "download [-s {diskette|disk} -f [-l {latest|previous}]]"
```

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-d</td>
<td>Device name is the name of the adapter.</td>
</tr>
<tr>
<td>-f</td>
<td>Force the download even if the current level of microcode is not on the media.</td>
</tr>
<tr>
<td>-l</td>
<td>Level of microcode to download. The default is latest.</td>
</tr>
<tr>
<td>-s</td>
<td>Microcode source of the new microcode. The default value is disk.</td>
</tr>
</tbody>
</table>

The microcode image file must be in /etc/microcode.
Download Microcode to Other Devices

The syntax of the command is as follows:

```
diag -c -d device_name -T "download [-s diskette] [-l previous] [-F]"
```

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-F</td>
<td>Force flag. Required to download microcode if the current level is unavailable on the source.</td>
</tr>
<tr>
<td>-l</td>
<td>Microcode level. Latest is default.</td>
</tr>
<tr>
<td>-s</td>
<td>Microcode source. /etc/microcode is default. Default source device is disk.</td>
</tr>
</tbody>
</table>

Fiber Channel RAID Service Aids

The Fibre Channel RAID (Redundant Array Independent Disk) service aids contain the following functions:

Certify LUN

This selection reads and checks each block of data in the LUN (Logical Unit Number). If excessive errors are encountered the user is notified.

You can run this task from the AIX command line. The syntax of the fastpath command is as follows:

```
diag -T "certify"
```

Certify Spare Physical Disk

This selection allows the user to certify (check integrity of the data) on drives that are designated as spares.

You can run this task from the AIX command line. The syntax of the fastpath command is as follows:

```
diag -T "certify"
```

Format Physical Disk

This selection formats a selected disk drive.

You can run this task from the AIX command line. The syntax of the fastpath command is as follows:

```
diag -T "format"
```

Array Controller Microcode Download

This selection allows the microcode on the Fibre Channel RAID controller to be updated when required.

You can run this task from the AIX command line. The syntax of the fastpath command is as follows:

```
diag -T "download"
```

Physical Disk Microcode Download

This selection is used to update the microcode on any of the disk drives in the array.

You can run this task from the AIX command line. The syntax of the fastpath command is as follows:

```
diag -T "download"
```

Update EEPROM

This selection is used to update the contents of the EEPROM (Electrically Erasable Programmable Read Only Memory) on a selected controller.

Replace Controller

Use this selection when it is necessary to replace a controller in the array.
Flash SK-NET FDDI Firmware

This task allows the Flash firmware on the SysKonnect SK-NET FDDI adapter to be updated.

Format Media

This task allows the selection of diskettes, hardfiles, or optical media to be formatted. Each selection is described below.

Hardfile Attached to SCSI Adapter (non-RAID)

- Hardfile Format
  - Writes all of the disk. The pattern written on the disk is device-dependent; that is, some drives might write all 0s, while some might write hexadecimal number 5F.
  - Resource Selection List (choice of floppy drive or hard drive)
  - If floppy (fd0):
    - Diskette Media Service Aid
    - Choose type of diskette to format
    - Formatting occurs
  - If Hard drive (hdisk0)
    - Format Media Task
    - Format and Certify Disk
    - Format without Certify
    - Erase Disk
- Hardfile Format and Certify
  Performs the same function as hard file Format. After the format is completed, certify runs. This certify reassigns all bad blocks that are encountered.
- Hardfile Erase Disk
  This option can be used to overwrite (remove) all data currently stored in user-accessible blocks of the disk. The Erase Disk option writes one or more patterns to the disk. An additional option allows data in a selectable block to be read and displayed on the system console.
  To use the Erase Disk option, specify the number (0-3) of patterns to be written. Select the patterns to be written; the patterns are written serially. That is, the first pattern is written to all blocks. Then the next pattern is written to all blocks, overlaying the previous pattern. A random pattern is written by selecting the Write random pattern? option.

  **Note:** The Erase Disk service aid has not been certified as meeting the Department of Defense or any other organizations’ security guidelines.

  If the data on the drive is to be overwritten, use the following steps:
  1. Use the Erase Disk selection to overwrite the data on the drive.
  2. Run a format without certify.
  3. Run a second pass of the Erase Disk selection.
For a newly installed drive, you can ensure that all blocks on the drive are overwritten with your pattern when you use the following procedure:

1. Format the drive.
2. Check the defect MAP (Maintenance Analysis Procedure) by running the Erase Disk selection.

   **Note:** If you use the Format and Certify option, there may be some blocks which get placed into the grown defect MAP.

3. If there are bad blocks in the defect MAP, record the information presented and ensure that this information is kept with the drive. This data is used when the drive is to be overwritten.
4. Use the drive as you would normally.
5. When the drive is no longer needed and is to be erased, run the same version of the Erase Disk selection that was used in step 2.

   **Note:** Using the same version of the service aid is only critical if there were any bad blocks found in step 3.

6. Compare the bad blocks which were recorded with the drive in step 3 with those that now appear in the grown defect MAP.

   **Note:** If there are differences between the saved data and the newly obtained data, then all sectors on this drive cannot be overwritten. The new bad blocks are not overwritten.

7. If the bad block list is the same, continue running the service aid to overwrite the disk with the chosen pattern(s).

This task can be run directly from the AIX command line. The syntax of the command is as follows: `diag -c -d deviceName -T "format [-s* fmtcert | erase -a {read | write}] [-F]"

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fmtcert</td>
<td>Formats and certifies the disk.</td>
</tr>
<tr>
<td>-F</td>
<td>Force flag. Forces disk erasure even if all blocks cannot be erased due to errors accessing grown defect map.</td>
</tr>
</tbody>
</table>

**Note:** Erase option in command line mode uses default values. To selectively read or write, use the diag command in console mode.

### Hardfile Attached to PCI SCSI RAID Adapter

This function formats the physical disks attached to a PCI SCSI RAID adapter. This task can be run directly from the AIX command line. The syntax of the command is as follows: `diag -c -d RAID adapterName -T "format {-l chId | -A }"

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-l chId</td>
<td>Physical disk channel/ID (An example of physical disk channel/ID is 27, where the channel is 2 and the ID is 7.)</td>
</tr>
<tr>
<td>-A</td>
<td>All disks</td>
</tr>
</tbody>
</table>
Optical Media

This function formats the media without certifying.

- Optical Media Initialize
  Formats the media without certifying. This function does not reassign the defective blocks or erase the data on the media. It provides a quick way of formatting the media and cleaning the disk.

  **Note:** It takes approximately one minute to format the media.

- Optical Media Format and Certify
  Formats and certifies the media. This function reassigns the defective blocks and erases all data on the media.

This task can be run directly from the AIX command line. The following usage statement describes the syntax of the command:

```
diag -c -d deviceName -T "format [-s {initialize | fmtcert}]"
```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>initialize</td>
<td>Formats media without certifying</td>
</tr>
<tr>
<td>fmtcert</td>
<td>Formats and certifies the media</td>
</tr>
</tbody>
</table>

Diskette Format

This selection formats a diskette by writing patterns to it.

Generic Microcode Download

This service aid provides a means of executing a generic script from a diskette. The intended purpose for this generic script is to load microcode to a supported resource. This script can run whatever program is required to download the microcode onto the adapter or device.

This service aid is supported in both concurrent and stand-alone modes from disk, LAN, or loadable media.

On entry, the service aid displays information about what it does. It then asks for a Genucode diskette to be inserted into the diskette drive. The diskette must be in tar format. The service aid restores the script file `genucode` to the `/tmp` directory. Then the script is executed. The script must at that point then pull any other needed files from the diskette. The script should then execute whatever program is necessary in order to perform its function. On completion, a status code is returned, and the user is returned to the service aid.

The `genucode` script should have a `#!/usr/bin/ksh` line at the beginning of the file. Return status of 0 should be returned if the program was successful, else a non-zero status should be returned.
Local Area Network Analyzer

This selection is used to exercise the LAN communications adapters (Token-Ring, Ethernet, and (FDDI) Fiber Distributed Data Interface). The following services are available:

- Connectivity testing between these two network stations. Data is transferred between the two stations, requiring the user to input the Web addresses of both stations.
- Monitoring ring (Token-Ring only). The ring is monitored for a specified period of time. Soft and hard errors are analyzed.

Log Repair Action

The Log Repair Action task logs a repair action in the AIX Error Log. A Repair Action Log indicates that a FRU has been replaced, and error log analysis should not be done for any errors logged before the repair action. The Log Repair Action task lists all resources. Replaced resources can be selected from the list, and when commit (F7 Key) is selected, a repair action is logged for each selected resource.

Periodic Diagnostics

This selection provides a tool for configuring periodic diagnostics and automatic error log analysis. You can select a hardware resource to be tested once a day, at a user-specified time. If the resource cannot be tested because it is busy, error log analysis is performed. Hardware errors logged against a resource can also be monitored by enabling Automatic Error Log Analysis. This allows error log analysis to be performed every time a hardware error is put into the error log. If a problem is detected, a message is posted to the system console and a mail message sent to the users belonging to the system group with information about the failure such as service request number.

The service aid provides the following functions:

- Add or delete a resource to the periodic test list
- Modify the time to test a resource
- Display the periodic test list
- Modify the error notification mailing list
- Disable or enable Automatic Error Log Analysis
PCI RAID Physical Disk Identify

This selection identifies physical disks connected to a PCI SCSI-2 F/W RAID adapter.

This task can be run directly from the AIX command line. The syntax of the command is as follows:

```
diag -c -d     pci RAID adapter -T identify
```

Process Supplemental Media

Diagnostic Supplemental Media contains all the necessary diagnostic programs and files required to test a particular resource. The supplemental media is normally released and shipped with the resource as indicated on the diskette label. Diagnostic Supplemental Media must be used when the device support has not been incorporated into the latest diagnostic CD-ROM.

This task processes the Diagnostic Supplemental Media. Insert the supplemental media when you are prompted, then press Enter. After processing has completed, go to the Resource Selection list to find the resource to test.

Run Diagnostics

The Run Diagnostics task invokes the Resource Selection List menu. When the commit key is pressed, diagnostics are run on all selected resources.

The procedures for running the diagnostics depend on the state of the diagnostics run-time options. See "Display or Change Diagnostic Run-Time Options" on page 126.

Run Error Log Analysis

The Run Error Log Analysis task invokes the Resource Selection List menu. When the commit key is pressed, Error Log Analysis is run on all selected resources.

Run Exercisers

This task provides a tool to troubleshoot intermittent system problems on AIX version 4.3.2 or later. This task provides an exerciser supervisor that controls the selected exercisers.

When you select Run Exercisers from the Task Selection menu, the EXERCISER SELECTION menu displays. Select the exerciser you want to run. Each exerciser has other menus to set options for that exerciser.

Exerciser Commands (Cmd)

Use the following commands as needed in the exerciser menus and reports. Not all commands are available in each menu or report.

<table>
<thead>
<tr>
<th>Cmd</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

44P Series Model 170 User's Guide 136
a  Acknowledge an error
b  Back one page
c  Toggle between cycle count and last error
e  View the AIX error log
f  Page forward one page
q  Return to Main Menu
r  Refresh screen
s  Enable or disable beep on error
x  Exit system exerciser

Acronyms
The following list describes abbreviations used in the exerciser reports. To toggle
between two states for (example, Activate/Halt Devices), use the number of the device.

<table>
<thead>
<tr>
<th>Acronym</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COE</td>
<td>Continue on error (use number to select.</td>
</tr>
<tr>
<td>CP</td>
<td>Device has run the specified number of cycles and is not running</td>
</tr>
<tr>
<td>DD</td>
<td>Exerciser has been terminated by a signal</td>
</tr>
<tr>
<td>ER</td>
<td>Device has stopped with an error</td>
</tr>
<tr>
<td>HG</td>
<td>Device is hung</td>
</tr>
<tr>
<td>HOE</td>
<td>Halt on error (use number to select)</td>
</tr>
<tr>
<td>RN</td>
<td>Device is running</td>
</tr>
<tr>
<td>ST</td>
<td>Device is stopped</td>
</tr>
</tbody>
</table>

Memory Exerciser
The memory exercisers are labeled memx, where x is a number for the exerciser. Multiple exercisers can be active.

The memory exerciser requests as many memory buffers as possible from AIX. The exerciser then fills the memory buffers with specified bit patterns, then reads and compares the memory buffers to the specified bit patterns.

On systems with multiple processors, a process is started for each processor. The free memory space is split evenly between the available processors, thus reducing the time required to exercise all of the memory.

If the system is working properly, no comparison errors are produced. If a nonrecoverable memory error occurs, the system crashes. Recoverable memory errors are logged by the AIX operating system.

The following items must be available to run this service aid:
- Online diagnostics loaded in maintenance mode
- 128 KB of free space in /etc/ltpp/diagnostics/data
- The following commands must be available:
  - vmstat
  - lsps
  - bootinfo
Save or Restore Hardware Management Policies

Use this service aid to save or restore the settings from Ring Indicate Power On Policy, Surveillance Policy, Remote Maintenance Policy and Reboot Policy.

- Save Hardware Management Policies
  This selection writes all of the settings for the hardware management policies to the /etc/lpp/diagnostics/data/hmpolicies file:

- Restore Hardware Management Policies
  This selection restores all of the settings for the hardware management policies from the contents of the /etc/lpp/diagnostics/data/hmpolicies file:

You can access this service aid directly from the AIX command line by entering:
/usr/lpp/diagnostics/bin/uspchrp -a

Save or Restore Service Processor Configuration

**Note:** This service aid runs on RSPC system units only.

Use this service aid to save or restore the Service Processor Configuration to or from a file. The Service Processor Configuration includes the Ring Indicator Power On Configuration.

- Save Service Processor Configuration
  This selection writes all of the settings for the Ring Indicate Power On and the Service Processor to the /etc/lpp/diagnostics/data/spconfig file.

- Restore Service Processor Configuration
  This selection restores all of the settings for the Ring Indicate Power On and the Service Processor from the /etc/lpp/diagnostics/data/spconfig file.

SCSI BUS Analyzer

This service aid enables you to diagnose a SCSI Bus problem in a free-lance mode.

To use this service aid, the user should understand how a SCSI bus works. Use this service aid when the diagnostics cannot communicate with anything on the SCSI bus and cannot isolate the problem. Normally the procedure for finding a problem on the SCSI bus with this service aid is to start with a single device attached, ensure that it is working, then start adding additional devices and cables to the bus, ensuring that each one works. This service aid works with any valid SCSI bus configuration.

The SCSI Bus Analyzer Service Aid transmits a SCSI Inquiry command to a selectable SCSI Address. The service aid then waits for a response. If no response is received within a defined amount of time, the service aid displays a timeout message. If an error occurs or a response is received, the service aid then displays one of the following messages:

- The exerciser transmitted a SCSI Inquiry command and received a valid response back without any errors being detected.
• The exerciser transmitted a SCSI Inquiry command and did not receive any response or error status back. Check that the address is valid, then retry.
• The exerciser transmitted a SCSI Inquiry command and the adapter indicated a SCSI bus error.
• The exerciser transmitted a SCSI Inquiry command and an adapter error occurred.
• The exerciser transmitted a SCSI Inquiry command and an unrecoverable I/O error occurred.

When the SCSI Bus Service Aid is started, a description of the service aid displays.

Press the Enter key to display the Adapter Selection menu. Use this menu to enter which address to transmit the SCSI Inquiry Command.

When the adapter is selected, the SCSI Bus Address Selection menu displays. Use this menu to enter which address to transmit the SCSI Inquiry Command.

After the address is selected, the SCSI Bus Test Run menu displays. Use this menu to transmit the SCSI Inquiry Command by pressing the Enter key. The service aid then indicates the status of the transmission. When the transmission is completed, the results of the transmission display.

**Notes:**
1. A Check Condition can be returned when the bus or device is working properly.
2. AIX does not allow the command to be sent if the device is in use by another process.

---

**SCSI Device Identification and Removal**

This service aid allows the user to choose a SCSI device or location from a menu and to identify a device located in a system unit that uses a SCSI Enclosure Services (SES) backplane.

The service aid also does the following:
• Generates a menu displaying all SCSI devices
• Lists the device and all of its sibling devices
• Lists all SCSI adapters and their ports
• Lists all SCSI devices on a port

---

**SCSI Tape Drive Service Aid**

This service aid enables you to obtain the status or maintenance information from a SCSI tape drive. Only some models of SCSI tape drive are supported.

The service aid provides the following options:
• Display time since a tape drive was last cleaned.
The time since the drive was last cleaned displays on the screen. In addition, a message indicating whether the drive is recommended to be cleaned is also displayed.

- Copy a tape drive’s trace table.

The trace table of the tape drive is written to diskettes or a file. The diskettes must be formatted for DOS. Writing the trace table may require several diskettes, but the actual number of diskettes is determined by the size of the trace table. Label the diskettes as follows:

'TRACE x DAT'

(where x is a sequential diskette number). The complete trace table consists of the sequential concatenation of all the diskette data files.

When the trace table is written to a disk file, the service aid prompts for a file name. The default name is: '/tmp/TRACE x ', where x is the AIX name of the SCSI tape drive being tested.

- Display or copy a tape drive’s log sense information.

The service aid provides options to display the log sense information to the screen, to copy it to a DOS formatted diskette or to copy it to a file. The file name LOGSENSE.DAT is used when the log sense data is written on the diskette. The service aid prompts for a file name when the log sense data is to be copied to a file.

This service aid can be run directly from the AIX command line. The syntax of the command is as follows (path is /usr/lpp/diagnostics/bin/utape):

```
utape [-h | -?] [-d device] [-n | -l | -t]
```

OR

```
utape -c -d device [-v] {-n | {-l | -t} { -D | -f [filename]}}
```

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-c</td>
<td>Run the service aid without displaying menus. The return code indicates success or failure. The output is suppressed except for the usage statement and the numeric value for hours since cleaned (if -n and -D flags are used).</td>
</tr>
<tr>
<td>-D</td>
<td>Copy data to diskette.</td>
</tr>
<tr>
<td>-f</td>
<td>Copy data to the filename given after this flag or to a default filename if no name is specified.</td>
</tr>
<tr>
<td>-h, -?</td>
<td>Display a usage statement and/or return code. If the -c flag is present, only the return code displays to indicate the service aid did not run. If the -c is not used, a usage statement displays and the service aid exits.</td>
</tr>
<tr>
<td>-l</td>
<td>Display or copy log sense information.</td>
</tr>
<tr>
<td>-n</td>
<td>Display time since drive was last cleaned.</td>
</tr>
<tr>
<td>-t</td>
<td>Copy trace table.</td>
</tr>
<tr>
<td>-v</td>
<td>Verbose mode. If the -c flag is present, the information displays on the screen. If the -n flag is present, the information about tape-head cleaning is printed.</td>
</tr>
</tbody>
</table>
Spare Sector Availability

This selection checks the number of spare sectors available on the optical disk. The spare sectors are used to reassign when defective sectors are encountered during normal usage or during a format and certify operation. Low availability of spare sectors indicates that the disk needs to be backed up and replaced. Formatting the disk does not improve the availability of spare sectors.

This task can be run directly from the AIX command line. The syntax of the command is as follows:

```
diag -c -d <deviceName> -T chkspares
```

SSA Service Aid

This service aid provides tools for diagnosing and resolving problems on SSA-attached devices. The following tools are provided:

- Set Service Mode
- Link Verification
- Configuration Verification
- Format and Certify Disk

Update Disk-Based Diagnostics

This service aid allows fixes (APARs) to be applied.

This task invokes the SMIT Update Software by Fix (APAR) task. The task allows the input device and APARs to be selected. Any APAR can be installed using this task.

Update System or Service Processor Flash

This selection updates the system or service processor flash for CHRP system units.

Further update and recovery instructions may be provided with the update. It is necessary to know the fully qualified path and file name of the flash-update image file that was provided. If the flash-update image file is on a diskette, the service aid can list the files on the diskette for selection.

Refer to the update instructions or the system unit’s service guide to determine the level of the system unit or service processor flash.

When run from online diagnostics, the flash-update image file is copied to the /var file system. If there is not enough space in the /var file system for the flash-update image file, an error is reported. If this occurs, exit the service aid, increase the size of the /var file system and retry the service aid. After the file is copied, a warning screen asks for confirmation to continue the update flash. Continuing the update flash reboots the system. The system does not return to diagnostics, and the current flash image is not saved. After the reboot, the /var/update_flash_image file can be removed.
When the service aid is running from stand alone diagnostics, the flash-update image file is copied to the file system from diskette. The user needs to provide the image on a diskette since the user does not have access to remote file systems or any other files that are on the system. If enough space is not available, an error is reported stating additional system memory is needed. After the file is copied, a warning screen asks for confirmation to continue the update flash. Continuing the update flash reboots the system. The current flash image is not saved.

The `update_flash` command can be used in place of this service aid. It is located in the `/usr/lpp/diagnostics/bin` directory.

Attention: The `update_flash` command reboots the entire system. Do not use this command if more than one user is logged in to the system.

---

**Update System Flash**

Note: This service aid runs on RSPC (Power PC Reference Platform) system units only.

This selection updates the system flash for RSPC systems.

The user provides a valid binary image either on diskette or from a qualified path name. The diskettes can be in DOS or in a backup format.

The flash-update image is copied to the `/var` file system. If there is not enough space in the file system for the flash update image file, an error is reported. If this occurs, increase the file size of the `/var` file system. The current flash image is not saved. The command automatically removes the `/var/update_flash_image` file.

After user confirmation, the command reboots the system twice to complete the flash update.

---

**7135 RAIDiant Array Service Aid**

The 7135 RAIDiant Array service aids contain the following functions:

- **Certify LUN**
  - Reads and checks each block of data in the LUN. If excessive errors are encountered, the user is notified.
- **Certify Spare Physical Disk**
  - Allows the user to certify (check the integrity of the data) on drives designated as spares.
- **Format Physical Disk**
  - Used to format a selected disk drive.
- **Array Controller Microcode Download**
  - Allows the microcode on the 7135 controller to be updated when required.
- **Physical Disk Microcode Download**
Used to update the microcode on any of the disk drives in the array.

- **Update EEPROM**
  Used to update the contents of the EEPROM on a selected controller.

- **Replace Controller**
  Used when it is necessary to replace a controller in the array.

### Adapter Microcode Download:
Usage: `diag -c -d deviceName -T "download [-B][-D][-P]"

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-B</td>
<td>Download boot block microcode (default to functional microcode)</td>
</tr>
<tr>
<td>-D</td>
<td>Microcode is on diskette (default to <code>/etc/microcode</code> directory)</td>
</tr>
<tr>
<td>-P</td>
<td>Download the previous level of microcode (default to latest level)</td>
</tr>
</tbody>
</table>

### Physical Disk Microcode Download:
Usage: `diag -c -d deviceName -T "download -l ChId [-D][-P]"

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-l</td>
<td>Physical disk channel/ID (for example, 27)</td>
</tr>
<tr>
<td>-D</td>
<td>Microcode is on diskette (default to <code>/etc/microcode</code> directory)</td>
</tr>
<tr>
<td>-P</td>
<td>Download the previous level of microcode (default to latest level)</td>
</tr>
</tbody>
</table>

### Physical Disk Format:
Usage: `diag -c -d deviceName -T "format -l ChId`

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-l</td>
<td>Physical disk channel/ID (for example, 27)</td>
</tr>
</tbody>
</table>

### Physical Disk Certify:
Usage: `diag -c -d deviceName -T "certify -l ChId`

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-l</td>
<td>Physical disk channel/ID (for example, 23)</td>
</tr>
</tbody>
</table>

### Physical Disk Identify:
Usage: `diag -c -d deviceName -T "identify"

---

**7318 Serial Communications Network Server Service Aid**

This service aid provides a tool for diagnosing terminal server problems.
Chapter 7. Using the System Verification Procedure

Use the system verification procedure to check the system for correct operation.

If you are analyzing a hardware problem, should use Chapter 8. Hardware Problem Determination on page 149.

Step 1. Considerations before Running This Procedure

Notes:
1. If this system unit is directly attached to another system unit or attached to a network, make sure that communications with the other system unit are stopped.
2. This procedure requires use of all of the system resources. No other activity can be running on the system while you are doing this procedure.
   • This procedure requires a display connected to the video port or an ASCII terminal attached to the S1 port.
   • Before starting this procedure, stop all programs and the operating system.
   • This procedure runs the Online Diagnostics in Service mode or Stand-alone Diagnostics. If the Online Diagnostics are installed, they should be run. See the operator manual for your type of ASCII terminal to find the key sequences you need to respond to the diagnostics.
   • If you need more information about diagnostics, see Chapter 5. Using the Standalone and Online Diagnostics on page 107.
   • If a console display is not selected, the diagnostics stop. The instructions for selecting a console display are displayed on all of the graphic displays and any terminal attached to the S1 port. Follow the displayed instructions to select a console display.
   • Go to Step 2.

Step 2. Loading the Diagnostics

1. Stop all application programs running on the operating system.
2. Stop the operating system.
3. Turn the power off.
4. If you are loading the Stand-alone Diagnostics and running them from an ASCII terminal, do the following:
   • The attributes for the terminal must be set to match the defaults of the diagnostics.
   • If you need to change any settings, record the normal settings, and be sure the terminal attributes are set to work with the diagnostics. If needed, see Appendix D. General Attributes Required When Using a TTY Terminal on page 167.
5. Turn the power on.
a. When the keyboard indicator appears, press F5 on the directly attached keyboard (5 on the ASCII keyboard) to load the Stand-alone Diagnostics or F6 on the directly attached keyboard (6 on the ASCII terminal keyboard) to load the Online Diagnostics.

b. Enter any requested passwords.

c. Follow the instructions to select a console.

6. When the Diagnostic Operating Instructions display, go to Step 3. If you are unable to load the diagnostics, go to "Problem Determination When Unable to Load Diagnostics" on page 156.

---

**Step 3. Running System Verification**

1. On the Diagnostic Operating Instructions screen, press the Enter key.

2. If the terminal type has not been defined, use the **Initialize Terminal** option on the Function Selection menu to initialize the operating system environment before you can continue with the diagnostics.

3. If you want to do a general checkout with minimal operator action, select the **Diagnostic Routines** option on the Function Selection menu.

   If you want to do a more complete checkout, including the use of wrap plugs, select the **Advanced Diagnostics** option on the Function Selection menu. The advanced diagnostics are primarily for the service representative; they may instruct you to install wrap plugs to better isolate a problem.

4. Select the **System Verification** option on the Diagnostic Mode Selection menu.

5. If you want to run a general checkout of all installed resources, Select the **All Resource** option on the Diagnostic Selection menu.

   If you want to check one particular resource, select that resource on the Diagnostic Selection menu.

---

**Step 4. Additional System Verification**

The checkout programs end with either the Testing Complete menu and a message stating

No trouble was found

or the A Problem Was Detected On (Time Stamp) menu with a SRN (service request number).

1. Press Enter to return to the Diagnostic Selection menu.

2. If you want to check other resources, select the resource. When you have checked all of the resources you need to check, go to Step 5.
Step 5. Stopping the Diagnostics

1. If you are running Online diagnostics, shut down the system using the following procedure:
   a. Press F3 repeatedly until you get to the Diagnostic Operating Instructions, then follow the displayed instructions.
   b. Press F3 once, and then follow the displayed instructions to shut down the system.
2. If you changed any attributes on your ASCII terminal to run the diagnostics, change the settings back to normal.
3. This completes the system verification. Report the SRN, if you received one, to the service organization. To do a normal boot, turn off the system unit and wait 30 seconds, and then set the power switch of the system unit to On.
Chapter 8. Hardware Problem Determination

This chapter provides information on using stand-alone or online diagnostics to help you solve hardware problems. In addition, it provides a list of error codes and recommended actions that you can take to resolve the problem before contacting a service representative.

Problem Determination Using the Stand-alone or Online Diagnostics

Use this procedure to obtain a service request number (SRN) when you are able to load the Stand-alone or Online Diagnostics. If you are unable to load the Stand-alone or Online Diagnostics, go to Problem Determination When Unable to Load Diagnostics on page 158. The service organization uses the SRN to determine which field replaceable units (FRUs) are needed to restore the system to correct operation.

Step 1. Considerations before Running This Procedure

Note: See the operator manual for your ASCII terminal to find the key sequences you need to respond to the diagnostic programs.

- The diagnostics can use a display connected to the video port or an ASCII terminal attached to a serial port.
- This procedure asks you to select the type of diagnostics you want to run. If you need more information about the types, see Chapter 5. Using the Standalone and Online Diagnostics on page 107.
- ISA adapters cannot be detected by the system. The ISA adapter Configuration Service Aid allows the identification and configuration of ISA adapters for Stand-alone Diagnostics. ISA adapters must be identified and configured before they can be tested.

- Go to Step 2.

Step 2

Are the Online Diagnostics installed on this system?

NO  Go to Step 15 on page 154.

YES  Go to Step 3 on page 154.
Step 3

Determine if the operating system is accepting commands.

Is the operating system accepting commands?

NO  The system must be turned off in order to run diagnostics.

Verify with the system administration and users that the system may be turned off. If so, then turn off the system unit and go to [Step 6 on page 151].

YES  Go to Step 4.

Step 4

Diagnostic tests can be run on many resources while the operating system is running. However, you can obtain more extensive problem isolation by running Online Diagnostics in Service mode.

Do you want to run the Online Diagnostics in Service mode?

NO  Go to Step 5.

YES  Do the following to shut down your system:

1. At the system prompt, stop the operating system using the appropriate command for your operating system.
2. After the operating system is stopped, power off the system unit.
3. Go to Step 6 on page 151.

Step 5

This step starts the Online Diagnostics in concurrent mode.

1. Log in as root user.
2. Enter the diag command.
3. Wait until the Diagnostic Operating Instructions are displayed, or wait for three minutes.

Are the Diagnostic Operating Instructions displayed without any obvious console display problems?

NO  Do the following to shut down your system:

1. At the system prompt, stop the operating system using the proper command for your operating system.
2. After the operating system is stopped, power off the system unit.
3. Go to Step 6 on page 151.

YES  Go to Step 9 on page 152.
Step 6

This step loads Online Diagnostics in service mode. If you are unable to load the diagnostics, go to [Step 7].

1. Turn the power on.
2. When the keyboard indicator (icon or text) appears, press F6 on the directly attached keyboard, or 6 on the ASCII terminal keyboard, to indicate that diagnostics are to be loaded.
3. Enter any requested passwords.
4. Follow any instructions to select a console.

Did the Diagnostics Operating Instructions display without any obvious display problem?

NO  Go to [Step 7].

YES  Go to [Step 9 on page 153].

Step 7

Starting at the top of the following table, find your symptom and follow the instructions given in the Action column.

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display problem</td>
<td>Go to [Step 8].</td>
</tr>
<tr>
<td>All other symptoms</td>
<td>Go to [Problem Determination When Unable To Load Diagnostics on page 156].</td>
</tr>
</tbody>
</table>

Step 8

The following steps analyze a console display problem.

Find your type of console display in the following table. Then follow the instructions given in the Action column.

<table>
<thead>
<tr>
<th>Console Display</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Device</td>
<td>Go to the display documentation for problem determination.</td>
</tr>
<tr>
<td>ASCII terminal</td>
<td>Go to the problem-determination documentation for this type of terminal.</td>
</tr>
</tbody>
</table>
Step 9

The diagnostics loaded correctly.

Press the Enter key.

Is the Function Selection menu displayed?

NO   Go to Step 10

YES  Go to Step 11

Step 10

There is a problem with the keyboard.

Find the type of keyboard you are using in the following table. Then follow the instructions given in the Action column.

<table>
<thead>
<tr>
<th>Keyboard Type</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>101–key keyboard. Identify by the type of Enter key used. The Enter key is within one horizontal row of keys.</td>
<td>Record error code M0KBD001 and report the problem to the service organization.</td>
</tr>
<tr>
<td>102–key keyboard. Identify by the type of Enter key used. The Enter key extends into two horizontal rows of keys.</td>
<td>Record error code M0KBD002 and report the problem to the service organization.</td>
</tr>
<tr>
<td>Kanji keyboard. Identify by the Japanese characters.</td>
<td>Record error code M0KBD003 and report the problem to the service organization.</td>
</tr>
<tr>
<td>ASCII–terminal keyboard. This applies to all attached terminals.</td>
<td>Go to the problem-determination documentation for this type terminal.</td>
</tr>
</tbody>
</table>

Step 11

1. If the terminal type has not been defined, use the Initialize Terminal option on the Function Selection menu to initialize the operating system environment before you can continue with the diagnostics. This is a separate and different operation from selecting the console display.

2. Select Diagnostic Routines.

3. Press the Enter key.

4. In the following table, find the menu or system response you received when you selected Diagnostics. Follow the instructions given in the Action column.

<table>
<thead>
<tr>
<th>System Response</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Diagnostic Mode Selection menu is displayed.</td>
<td>Select Problem Determination and go to Step 12 on page 153.</td>
</tr>
</tbody>
</table>
The Missing Resource menu is displayed. Follow the displayed instructions until either the Diagnostic Mode Selection menu or an SRN is displayed.

If the Diagnostic Mode Selection menu is displayed, select Problem Determination and go to Step 12.

If you get an SRN, record it, and go to Step 14 on page 154.

The New Resource menu is displayed. Follow the displayed instructions. Note: Devices attached to serial ports S1 or S2 do not appear on the New Resource menu. Also, ISA adapters do not appear unless they have been identified and configured.

If the Diagnostic Mode Selection menu is displayed, select Problem Determination and go to Step 12.

If you get an SRN, record it, and go to Step 14 on page 154.

If you do not get an SRN, go to Step 17 on page 155.

The system does not respond to selecting diagnostics. Go to Step 10 on page 153.

### Step 12

**Did the Diagnostic Selection Menu display?**

**NO**  
If Problem Determination was selected from the Diagnostic Mode Selection menu, and if a recent error has been logged in the error log, the diagnostics automatically begin testing the resource.

Follow the displayed instructions.

- If the No Trouble Found screen is displayed, press Enter.
- If another resource is tested, repeat this step.
- If the Diagnostic Selection menu is displayed, go to Step 13.
- If an SRN is displayed, record it, and go to Step 14 on page 154.

**YES**  
Go to Step 13.

### Step 13

The All Resources option checks most of the configured adapters and devices.
Select and run the diagnostic tests on the resources you are having problems with or select the **All Resources** option to check all of the configured resources. Find the response in the following table and follow the instructions given in the Action column.

<table>
<thead>
<tr>
<th>Diagnostic Response</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>An SRN is displayed.</td>
<td>Go to <a href="#">Step 14</a></td>
</tr>
<tr>
<td>The Testing Complete menu and the <strong>No trouble was found</strong> message is displayed, and</td>
<td>Press Enter and continue with the testing.</td>
</tr>
<tr>
<td>you have not tested all of the resources.</td>
<td></td>
</tr>
<tr>
<td>The Testing Complete menu and the <strong>No trouble was found</strong> message displayed and you</td>
<td>Go to <a href="#">Step 17 on page 152</a></td>
</tr>
<tr>
<td>have tested all of the resources.</td>
<td></td>
</tr>
</tbody>
</table>

**Step 14**

The diagnostics produced an SRN for this problem. Do the following:

1. Record the SRN and other numbers read out.
2. Report the SRN to the service organization.
3. **STOP.** You have completed these procedures.

**Step 15**

When you are loading the Stand-alone Diagnostics, the attributes for the terminal must be set to match the defaults of the diagnostic programs. The ASCII terminal must be attached to serial port 1 on the system unit.

Are you going to load Stand-alone Diagnostics and run them from a ASCII terminal?

**NO**

Go to [Step 16](#)

**YES**

Go to [Running Diagnostics from a TTY Terminal](#) on page 109, and be sure your terminal attributes are set to work with the diagnostic programs.

Return to [Step 16](#) when you finish checking the attributes. Record any settings that are changed.

**Step 16**

This step loads the Stand-alone Diagnostics. If you are unable to load the diagnostics, go to [Step 7](#) on page 153.

1. Turn the power on.
2. Insert the diagnostic CD-ROM into the CD-ROM drive.
3. When the keyboard indicator displays, press F5 on the directly attached keyboard, or 5 on the ASCII keyboard, to indicate that diagnostics are to be loaded.
4. Enter any requested passwords.
5. Follow any instructions to select a console.

Did the Diagnostics Operating Instructions display without any obvious display problem?

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>NO</td>
<td>Go to [Step 7 on page 151]</td>
</tr>
<tr>
<td>YES</td>
<td>Go to [Step 9 on page 152]</td>
</tr>
</tbody>
</table>

---

**Step 17**

The diagnostics did not find a hardware problem. If you still have a problem, contact your software support center.
Problem Determination When Unable to Load Diagnostics

Use this procedure to obtain an error code. The service organization uses the error code to determine which field replaceable units (FRUs) are needed to restore the system to correct operation.

Step 1. Considerations before Running This Procedure

- The diagnostics can use a display connected to the video port or an ASCII terminal attached to a serial port.
- Go to [Step 2].

Step 2

Are the Online Diagnostics installed on this system?

NO  Go to [Step 4 on page 157].
YES Go to [Step 3].

Step 3

This step attempts to load Online Diagnostics in service mode.

1. Turn the power to off.
2. Turn the power on.
3. If the keyboard indicator displays, press F6 on the directly attached keyboard, or 6 on the ASCII keyboard, to indicate that diagnostics are to be loaded.
4. Enter any requested passwords.
5. Follow any instructions to select a console.
6. Wait until the diagnostics load or the system appears to stop.

Did the diagnostics load?

NO  Go to [Step 5 on page 157].
YES Go to [Step 6 on page 159].
Step 4

This step attempts to load the Stand-alone diagnostics.

1. Turn the power to off.
2. Turn the power to on.
3. Insert the diagnostic CD-ROM into the CD-ROM drive.
4. If the keyboard indicator displays, press F6 on the directly attached keyboard, or 6 on the ASCII keyboard, to indicate that diagnostics are to be loaded.
5. Enter any requested passwords.
6. Follow any instructions to select a console.
7. Wait until the diagnostics load or the system appears to stop.

Did the diagnostics load?

NO  Go to [Step 5].

YES  Go to [Step 6 on page 153].

Step 5

Starting at the top of the following table, find your symptom and follow the instructions given in the Action column.

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>The power LED does not come on, or comes on and does not stay on.</td>
<td>Check the power cable to the outlet. Check the circuit breakers and check for power at the outlet. Ensure the room temperature is within 60 - 90°F. If you do not find a problem, record error code M0PS0000 and report the problem to the service organization.</td>
</tr>
<tr>
<td>The system appears to be stopped and NO beep was heard from the system unit.</td>
<td>Processor POST failure. Report error code M0CPU000.</td>
</tr>
<tr>
<td>The system appears to be stopped and NO beep was heard from the system unit. E122, E123, or E124 is displayed on the operator panel display.</td>
<td>No good memory could be found. Report error code M0MEM000.</td>
</tr>
<tr>
<td>The system appears to be stopped. A beep was heard from the system unit.</td>
<td>No good memory could be found. Report error code M0MEM001.</td>
</tr>
<tr>
<td>The diagnostics are loaded and there was NO beep heard from the system unit during the IPL sequence.</td>
<td>Record error code M0SPK001.</td>
</tr>
<tr>
<td>The system stops with the Diagnostic Operating Instructions displayed.</td>
<td>Go to [Step 6 on page 153]</td>
</tr>
<tr>
<td>Symptom</td>
<td>Action</td>
</tr>
<tr>
<td>------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>The diskette LED is blinking rapidly, or E1EA or E1EB is displayed on</td>
<td>The flash EPROM data is corrupted. Run the recovery procedure for the flash EPROM.</td>
</tr>
<tr>
<td>the operator panel.</td>
<td></td>
</tr>
<tr>
<td>The system stops with a prompt to enter a password.</td>
<td>Enter the password. You are not allowed to continue until a correct password has been entered. When you have entered a valid password, wait for one of the other conditions to occur.</td>
</tr>
<tr>
<td>The system stops with an eight-digit error code(s) displayed on the</td>
<td>Record the error code(s) and report the problem to the service organization.</td>
</tr>
<tr>
<td>console.</td>
<td></td>
</tr>
<tr>
<td>The system login prompt is displayed.</td>
<td>You may not have pressed the correct key, or you may not have pressed the key soon enough when you were to indicate a Service Mode boot of diagnostic programs. If this was the case, start over at the beginning of this step. If you are sure you pressed the correct key in a timely manner go to Step 7.</td>
</tr>
<tr>
<td>The system does not respond when the password is entered.</td>
<td>Go to Step 7.</td>
</tr>
<tr>
<td>The system stopped and an indicator is displayed on the system console</td>
<td>If the indicator (text or icon) represents:</td>
</tr>
<tr>
<td>and an eight-digit error code is not displayed.</td>
<td>- A keyboard, record error code M0KBD000 and report the problem to the service organization.</td>
</tr>
<tr>
<td></td>
<td>- Memory, record error code M0MEM002 and report the problem to the service organization.</td>
</tr>
<tr>
<td></td>
<td>- SCSI, record error code M0CON000 and report the problem to the service organization.</td>
</tr>
<tr>
<td></td>
<td>- Network, record error code M0NET000 and report the problem to the service organization.</td>
</tr>
<tr>
<td></td>
<td>- Speaker/Audio, record error code M0BT0000 and report the problem to the service organization.</td>
</tr>
</tbody>
</table>
## Symptom
The System Management Services menu is displayed.

## Action
The device or media you are attempting to boot from might be faulty.

1. Check the SMS error log for any errors. To check the error log:
   - Select tools
   - Select error log
   - If an error is logged, check the time stamp.
   - If the error was logged during the current boot attempt, record it and report it to your service person.
   - If no recent error is logged in the error log, continue to the next step below.

2. If you are attempting to load the Online Diagnostics, try loading the Stand-alone Diagnostics. Otherwise, record error code M0SCSI01 and report to your service representative.

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>The system appears to be stopped, the disk activity light is on continuously, and a beep was heard from the system unit.</td>
<td>Record error code M0MEM001 and report the problem to the service organization.</td>
</tr>
<tr>
<td>The system stops and the message STARTING SOFTWARE PLEASE WAIT ... is displayed.</td>
<td>Report error code M0BT0000.</td>
</tr>
<tr>
<td>The message “The system will now continue the boot process” is displayed continuously on the system unit’s console.</td>
<td>Report error code M0SCSI01.</td>
</tr>
</tbody>
</table>

### Step 6
The diagnostics loaded correctly.

Go to [Problem Determination Using the Stand-alone or Online Diagnostics on page 143](#).

### Step 7
There is a problem with the keyboard.

Find the type of keyboard you are using in the following table. Then follow the instructions given in the Action column.

<table>
<thead>
<tr>
<th>Keyboard Type</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>101-key keyboard. Identify by the type of Enter key used. The Enter key is within one horizontal row of keys.</td>
<td>Record error code M0KBD0001 and report the problem to the service organization.</td>
</tr>
</tbody>
</table>
# Keyboard Type and Action

Appendix A. Environmental Notices

Product Recycling and Disposal

This unit contains materials such as circuit boards and connectors with lead that require special handling and disposal at end of life. Before this unit is disposed, these materials must be removed and recycled or discarded according to applicable regulations. This manual contains specific information on batteries where applicable. This product may contain nickel-cadmium and/or lithium batteries. The battery(s) must be recycled or disposed of properly. Recycling facilities may not be available in your area. In the United States, IBM has established a collection process for reuse, recycling, or proper disposal of used sealed lead acid, nickel cadmium and nickel metal hydride batteries and battery packs from IBM equipment. For information on proper disposal of the nickel cadmium batteries in this product, please contact IBM at 1-800-426-4333. For information on battery disposal outside the United States, contact your local waste disposal facility.

Environmental Design

The environmental efforts that have gone into the design of this system signifies IBM’s commitment to improve the quality of its products and processes. Some of these accomplishments include the elimination of the use of Class I ozone-depleting chemicals in the manufacturing process and reductions in manufacturing wastes. For more information, contact an IBM account representative.
Appendix B. Notices

This information was developed for products and services offered in the U.S.A.

The manufacturer may not offer the products, services, or features discussed in this document in other countries. Consult the manufacturer’s representative for information on the products and services currently available in your area. Any reference to the manufacturer’s product, program, or service is not intended to state or imply that only that product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any intellectual property right of the manufacturer may be used instead. However, it is the user’s responsibility to evaluate and verify the operation of any product, program, or service.

The manufacturer may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send license inquiries, in writing, to the manufacturer.

The following paragraph does not apply to the United Kingdom or any country where such provisions are inconsistent with local law: THIS MANUAL IS PROVIDED “AS IS” WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions; therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. The manufacturer may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Information concerning products made by other than the manufacturer was obtained from the suppliers of those products, their published announcements, or other publicly available sources. The manufacturer has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to products made by other than the manufacturer. Questions on the capabilities of products made by other than the manufacturer should be addressed to the suppliers of those products.
Appendix C. Checking the Current Firmware Levels

To check the current levels that are installed on the system, do the following:

1. Log in as root user.
2. Enter the following command:
   
   `lscfg -vp | grep alterable`
3. Press enter. A report will be produced similar to the following:

   ROM Level.(alterable).......sh000221  <== service processor F/W level
   ROM Level.(alterable).......SPH00056  <== system F/W level

Notes:

1. In the example above, if the current version of service processor firmware is
   sh000221, the last six characters of the ROM Level represent a date in a yymmd format, where
   yy is the last two digits of the year, mm is the month and dd is the day
   of the firmware (Julian date).

2. Also in the example above, if the current version of system firmware is SPH00056,
   the last five characters of the ROM Level represent a date in a yyddd format, where
   yy is the last two digits of the year and ddd is the Gregorian date of the firmware.

Check the RS/6000 support web site at http://www.rs6000.ibm.com/support/micro for the
latest level of downloadable firmware and update instructions. If the version of system
firmware installed on your system is newer than (has a later date) or the same date as
the system firmware shown on the web site, do not download and apply the update. If
the version of service processor firmware installed on your system is newer than (has a
later date) or the same date as the service processor firmware shown on the web site,
do not download and apply the update.
Appendix D. General Attributes Required When Using a TTY Terminal

The following general attributes are the default settings for the diagnostic programs. Be sure your terminal is set to these attributes.

**Note:** Set these attributes before the diagnostic programs are loaded.

<table>
<thead>
<tr>
<th>General Setup Attributes</th>
<th>3151 /11/31/41 Settings</th>
<th>3151 /51/61 Settings</th>

Appendix E. Modem Configurations

The service processor is designed to place little demand on the attached modem, thereby increasing the setup and connection success rates.

Sample Modem Configuration Files

Several sample modem configurations files are supplied that either work directly with your modem, or provide a good starting point for a custom setup, if required. These files are included on the Sample Modem Configuration Files diskette and in your service processor firmware with the following names:

<table>
<thead>
<tr>
<th>Diskette File Name</th>
<th>service processor Firmware File Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>modem_z.cfg</td>
<td>modem_z.sp</td>
</tr>
<tr>
<td>modem_z0.cfg</td>
<td>modem_z0.sp</td>
</tr>
<tr>
<td>modem_f.cfg</td>
<td>modem_f.sp</td>
</tr>
<tr>
<td>modem_f0.cfg</td>
<td>modem_f0.sp</td>
</tr>
<tr>
<td>modem_f1.cfg</td>
<td>modem_f1.sp</td>
</tr>
<tr>
<td>modem_m0.cfg</td>
<td>modem_m0.sp</td>
</tr>
<tr>
<td>modem_m1.cfg</td>
<td>modem_m1.sp</td>
</tr>
</tbody>
</table>

The sample modem configuration files are located in the /usr/share/modems subdirectory, if your server is using AIX. A listing of each file is included at the end of this appendix.

Use the following selection procedures and your modem manual, to determine which of the configuration files is suitable for your use.

Configuration File Selection

1. Is your modem an IBM 7852-400?
   If Yes, use modem configuration file `modem_m0.cfg` and then go to step 7.

   **Note:** The IBM 7852-400 modem has DIP switches on the right side of the unit. See IBM 7852-400 DIP Switch Settings on page 174 for the correct switch settings.

   If No, continue with step 2.

2. Is your modem an IBM 7857-017?
   If Yes, use modem configuration file `modem_m1.cfg` and then go to step 7.

   **Note:** The IBM 7857-017 modem has two telephone line connections on the back of the unit. One is marked LL (for Leased Line), and the other is marked...
PTSN (for Public Telephone Switched Network). The service processor expects to use the modem on the public network, so the telephone line should attach to the PTSN connector.

If No, continue with step 3.

3. Does your modem respond to the extended command set (prefixed with &)?
   If Yes, go to step 5.
   OR
   If No, continue with step 4.

4. Does your modem respond to:
   - ATZ reset command,
   - OR
   - ATZn reset commands, where n can be 0, 1, and so on?
     If ATZ, configuration file `modem_z.cfg` is recommended. If ATZn, configuration file `modem_z0.cfg` is recommended.
     Go to step 7.

5. Does your modem command set include a test for V.42 error correction at the remote modem (often called “Auto-Reliable Mode”)?
   If Yes, disable this test. You can use sample configuration files `/usr/share/modem_m0.cfg`
   OR
   `/usr/share/modem_m1.cfg` as models to help you create a file for your particular modem. See "Customizing the Modem Configuration Files" on page 173. Go to step 7.
   If No, go to step 6.

6. Does your modem respond to:
   - AT&F reset command,
   - OR
   - AT&Fn reset commands, where n can be 0, 1, and so on.?
     If AT&F, configuration file `modem_f.cfg` is recommended.
     If AT&Fn, configuration file `modem_f0.cfg` or `modem_f1.cfg` is recommended, depending on which provides the hardware flow control profile.

7. You have completed selection of the configuration file.
   If your modem configuration selection is not available in the Service Processor Modem Configuration Menu, you must access it through the Configure Remote Maintenance Policy Service Aid.
   If you find it necessary to adjust any of these configuration files, do so with reference to the manual that came with your modem. It is recommended you select settings that enable hardware flow control and respond to DTR.

   **Note:** Some older modems do not respond to the commands X0 or &R1. You should edit out these commands from the modem configuration file if yours is such a modem. See your modem manual for more information.
Note: Some modems, such as the IBM 7857-017, are not designed for the paging function. Although they can be used for paging, they return an error message when they do not get the expected response from another modem. Therefore, even though the paging was successful, the error message causes the Service Processor to retry, continuing to place pager calls for the number of retries specified in the Call-Out Policy Setup Menu. These retries result in redundant pages.

Examples for Using the Generic Sample Modem Configuration Files

<table>
<thead>
<tr>

<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Note: ** Ring interrupt only on first ring.

Customizing the Modem Configuration Files

You can create your own modem configuration files or modify the samples provided. After you customize your modem configuration files, you must access them through the Configure Remote Maintenance Policy Service Aid rather than from the service processor menus.

Notes:
1. If you have already set up your serial ports, line speeds, authorizations and telephone numbers from the service processor menus, use the service aid to specify your customized modem configuration files.
2. If you have not already set up your serial ports, line speeds, authorizations, and telephone numbers from the service processor menus, you can use the service aids to set them while you specify your customized modem configuration files.

To disable Auto-Reliable Mode testing of the remote modem, use the sample modem configuration file `/usr/share/modems/modem_f.cfg` as a model to modify.

1. Find the necessary command in your modem manual.
2. Copy the `/usr/share/modems/modem_f.cfg` file to a new file with a different name (for example `modem_fx.cfg`).

3. In the new file (`modem_fx.cfg`), change the line `Send "ATE0T\r"` to `Send "ATcccE0T\r"` where `ccc` is the added command as specified your modem manual, as follows:

   Change the third line of each of the following stanzas:
   - `condout`
   - `condin`
   - `ripo`

4. Save the changes.

IBM 7852-400 DIP Switch Settings

If you are using a 7852-400 modem to enable service processor communications, the DIP (dual inline package) switches must be set according to the following table.

<table>
<thead>
<tr>
<th>Switch</th>
<th>Position</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Up</td>
<td>Force DTR</td>
</tr>
<tr>
<td>2</td>

</tr>
<tr>
<td>15</td>
<td>Up</td>
<td>2-Wire Leased Line Enabled</td>
</tr>
</tbody>
</table>

* Only switches 11 and 12 are changed from the factory default settings.

Xon/Xoff Modems

Some early modems assume software flow control (Xon/Xoff) between the computer and the modem. Modems with this design send extra characters during and after the transmitted data. The service processor cannot accept these extra characters. If your configuration includes such a modem, your functional results may be unpredictable.

The sample modem configuration files included in this package do not support these modems, so custom configuration files are necessary. Anchor Automation 2400E is an example of such a modem.

If you experience unexplainable performance problems that may be due to Xon/Xoff characters, it is recommended that you upgrade your modem.
Ring Detection

Most modems produce an interrupt request each time they detect a ring signal. Some modems generate an interrupt only on the first ring signal that they receive. AT&T Data Port 2001 is an example of such a modem.

The service processor uses the ring interrupt request to count the number of rings when Ring Indicate Power-On (RIPO) is enabled. If your modem produces an interrupt on only the first ring, set Ring Indicate Power-On to start on the first ring. Otherwise, you can choose to start Ring Indicate Power-On on any ring count.

Terminal Emulators

The service processor is compatible with simple ASCII terminals, and therefore compatible with most emulators. When a remote session is handed off from the service processor to the operating system, agreement between terminal emulators becomes important.

The server’s operating system will have some built-in terminal emulators. You may also have a commercially available terminal emulation. It is important that the local and host computers select the same or compatible terminal emulators so that the key assignments and responses match, ensuring successful communications and control.

For best formatting, choose line wrap in your terminal emulator setup.

Recovery Procedures

Situations such as line noises and power surges can sometimes cause your modem to enter an undefined state. When it is being used for dial-in, dial-out or ring indicate power-on, your modem is initialized each time one of these actions is expected. If one of these environmental conditions occur after your modem has been initialized, it may be necessary to recover your modem to a known state.

If your modem communicates correctly with remote users, it is probably in control. It may be wise to occasionally change some of the functional settings and then change them back, just for the sense of security that the modem is communicating, and to ensure it has been initialized recently.

If your system is particularly difficult to access physically, another strategy is to protect it with an Uninterruptable Power Source (UPS) and a phone-line surge protector.

In case recovery becomes necessary, shut down your system as gracefully as possible. Disconnect the power cable and press the power button to drain capacitance while power is disconnected. Disconnect and reconnect modem power, then reconnect system power to completely reinitialize your system.

Transfer of a Modem Session

Because many modem command variations exist, the sample modem configuration files located at the end of this appendix have been written to capture the largest number of workable modem settings.
The modem command &Dn (where ‘n’ is a number) generally sets the modem response to the Data Terminal Ready (DTR) signal from the server’s serial port. The desired response is that the modem will hold a connection while DTR is enabled, and drop the connection when DTR is released. This is the mechanism by which the server hangs up on a connection under normal conditions.

Consult your modem manual for its specific response scheme for the &Dn command.

Two strategies are available for dealing with the modem’s response to DTR:

- Recovery
- Prevention

Before you use one of these strategies, determine if your server’s modem is set up properly to respond to DTR.

With the remote terminal connected to serial port 1 and defined as the Primary Console Device, there are two tests you can perform:

1. Will the modem drop the connection after the System initialization complete message displays at the remote terminal?
   - If Yes, the modem is set up correctly.
   - If No, try another &Dn setting for your server’s modem. See your modem manual for this information. The &Dn command appears in three places each in three of the sample modem configuration files:
     - modem_f.cfg
     - modem_f0.cfg
     - modem_f1.cfg

2. Will the server’s modem disconnect when the power drops? You can make this observation at the remote terminal by commanding your server to shutdown and power off. (The AIX command shutdown -F will do this.) Watch for the message NO CARRIER on your remote terminal.
   - If Yes, this is the correct response. The modem is set up correctly.
   - If No, try another &Dn setting for your server’s modem. See your model manual for this information. The &Dn command appears in three places each in three of the sample modem configuration.

If you are using modem_z.cfg or modem_z0.cfg, you cannot control DTR response. If your remote terminal does not disconnect after logging off, you must command the remote terminal emulator to hang up. This then breaks the connection.

**Recovery Strategy**

The recovery strategy consists of making two calls to establish a remote session. This is the easiest solution to implement, and allows more freedom for configuring your server’s serial ports.
To set up a remote terminal session, dial into the service processor and start the system. After the operating system is loaded and initialized, the connection will be dropped. At this point, you call the server back and the operating system will answer and offer you the login prompt.

Prevention Strategy
The disconnect is caused by the operating system when it initializes the Primary Console. The modem tests listed above are conducted with the remote terminal selected as the primary console to manifest the modem's response to DTR transitions.

- If a local ASCII terminal or a graphics console is to be a permanent part of your server, then make one of them the primary console. Your remote terminal will no longer experience the connection loss.
- If a local console is not a permanent part of your server, you can still assign either the unused graphics console or the unused serial port as the primary console. This gives you the desired seamless connection at your remote terminal.
- If you choose to use the unused serial port as the primary console, some initialization traffic will be sent to any serial device attached to that port. As a result, that serial device's connection and function could be affected. These impacts may make that port unattractive for devices other than a temporary local ASCII terminal.

Modem Configuration Samples

Sample File modem_z.cfg

```
# COMPONENT_NAME: (ESPSetup) ENTRY SERVICE PROCESSOR SETUP Z
#
# FUNCTIONS: Modem configuration file for many early Hayes* compatible modems.
# This example uses the ATZ reset command to choose the factory defaults.
# This setup will work for many modems, but it is required for early vintage
# modems which respond to neither the ATZ0 reset command nor the extended (&) 
# commands. Refer to your modem manual.

# COMPONENT_NAME: (ESPSETUP) ENTRY SERVICE PROCESSOR SETUP Z0
#
# FUNCTIONS: Modem configuration file for some early Hayes* compatible modems.
# This example uses the ATZ0 reset command to choose the factory defaults.
# This setup is recommended for modems that will respond to the ATZ0 command
# and which do not respond to the extended (&) commands. Refer to your modem
# manual.
#
# * Trademark of Hayes Microcomputer Products, Inc.
If the modem has configuration switches, they should be set to the factory default settings.
