XtCreateApplicationContext, XtDestroyApplicationContext, XtWidgetToApplicationContext, XtToolkitInitialize – create, destroy, and obtain an application context

XtAppContext XtCreateApplicationContext()

void XtDestroyApplicationContext(app_context)

app_context app_context;

XtAppContext XtWidgetToApplicationContext(w)

Widget w;

void XtToolkitInitialize()

app_context Specifies the application context.

w Specifies the widget.

The XtCreateApplicationContext function returns an application context, which is an opaque type. Every application must have at least one application context.

The XtDestroyApplicationContext function destroys the specified application context as soon as it is safe to do so. If called from with an event dispatch (for example, a callback procedure), XtDestroyApplicationContext does not destroy the application context until the dispatch is complete.

The XtWidgetToApplicationContext function returns the application context for the specified widget.

XtDisplayInitialize(3Xt)
