XtGetSelectionRequest – retrieve the event that triggered the XtConvertSelectionProc

XSelectionRequestEvent* XtGetSelectionRequest(w, selection, request_id)

    Widget w;
    Atom selection;
    XtRequestId request_id;

w          Specifies the widget.
selection   Specifies the selection being processed.
request_id  Specifies the requestor id in the case of incremental selections, or NULL in the case of
            atomic transfers.

XtGetSelectionRequest may only be called from within an XtConvertSelectionProc procedure and
returns a pointer to the SelectionRequest event that caused the conversion procedure to be invoked.
Request_id specifies a unique id for the individual request in the case that multiple incremental transfers are
outstanding. For atomic transfers, request_id must be specified as NULL. If no SelectionRequest event is
being processed for the specified widget, selection, and request_id, XtGetSelectionRequest returns NULL.
