XtMapWidget, XtSetMappedWhenManaged, XtUnmapWidget – map and unmap widgets

XtMapWidget(w)
    Widget w;
void XtSetMappedWhenManaged(w, map_when_managed)
    Widget w;
    Boolean map_when_managed;
XtUnmapWidget(w)
    Widget w;

map_when_managed
    Specifies a Boolean value that indicates the new value of the map_when_managed field.
    w
    Specifies the widget.

If the widget is realized and managed and if the new value of map_when_managed is True, XtSetMappedWhenManaged maps the window. If the widget is realized and managed and if the new value of map_when_managed is False, it unmaps the window. XtSetMappedWhenManaged is a convenience function that is equivalent to (but slightly faster than) calling XtSetValues and setting the new value for the mappedWhenManaged resource. As an alternative to using XtSetMappedWhenManaged to control mapping, a client may set mapped_when_managed to False and use XtMapWidget and XtUnmapWidget explicitly.
