Edition Notice
Executive Summary

In recently conducted measurements, using Lotus Development Corporation’s NotesBench benchmark, the IBM Netfinity 3500 system demonstrated leadership price/performance running Lotus Domino Server Release 4.6a on Microsoft Windows NT Server Version 4.0 with Service Pack 3. The results for the IBM Netfinity 3500 are based on the NotesBench Mail-only workload run on a single configuration. The results are summarized in the following table.

<table>
<thead>
<tr>
<th>Test Script</th>
<th>Maximum Users</th>
<th>NotesMark (tpm)</th>
<th>Ave. Response Time (sec)</th>
<th>$/User</th>
<th>$/NotesMark</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mail-Only</td>
<td>820</td>
<td>1,041</td>
<td>2.389</td>
<td>$7.44</td>
<td>$5.86</td>
</tr>
</tbody>
</table>

The IBM Netfinity 3500, configured with one 233MHz\(^1\) Intel\(^*\) Pentium\(^*\) II processor, 320MB of memory, and two 4.51GB\(^2\) hard disk drives, supported a Mail-only workload of 820 active mail users (see price/performance results\(^3\) above).

In addition to the IBM Netfinity 3500 system under test (SUT), the benchmarked configuration used three destination servers and six client driver systems, and one controller system. All systems were connected on a single 100Mbps Ethernet LAN segment, using the TCP/IP network protocol. Configuration details are provided in Appendix A: Overall Test Setup and Software Versions.

IBM’s Server Performance Laboratory in Research Triangle Park, NC, conducted the benchmark in December, and KMDS Technical Associates, Inc., audited the results in January 1998.

NotesBench provides an objective method for evaluating the performance of different platforms running Lotus Domino Server Release 4.6a. NotesBench generates a transactions-per-minute (tpm) throughput metric, called a NotesMark, for each test, along with a value for the maximum capacity (number of users) supported, and the average response time.

Benchmarking Objectives

The benchmark objective was to provide customers with information on the number of Lotus Domino Server Release 4.6a Mail-only users supported on the new IBM Netfinity 3500 system with one 233MHz Pentium II processor. Performance measurements on IBM PC Servers using NotesBench for the Domino Server Release 4.6x are ongoing.

---

\(^1\) MHz only measures microprocessor internal clock speed, not application performance. Many factors affect application performance.

\(^2\) When referring to hard disk capacity, GB equals one billion bytes. Total user-accessible capacity depends on operating environment.

\(^3\) The price/performance results are based on pricing provided by an IBM Business Partner. IBM resellers set their own prices, and actual prices may vary.
Test Methodologies

Test Setup and Hardware/Software Configuration

The IBM Netfinity 3500 system under test was configured with one 233MHz Pentium II processor (512KB of L2 write-back cache); 320MB of memory, and two 4.51GB Wide Ultra SCSI hard disks. The integrated Wide Ultra SCSI PCI controller and the integrated 100/10Mbps Ethernet adapter were used for this test.

A single 100Mbps Ethernet LAN segment was used. The system under test, the destination servers, and the driver systems were connected to the LAN by two cascaded Asante 100BaseT Hubs. A 150MHz Pentium-based system was used as the source driver (parent) system; IBM PC 350 computers were used as the client driver (child) systems. Three IBM PC Server 720 systems were used as destination servers. Destination mail addresses were distributed across these three destination servers.

The IBM Netfinity 3500 system under test ran Microsoft Windows NT Server Version 4.0 and Domino Server Release 4.6a. The Name and Address Book in all the clients contained person documents for 3,000 mail recipients who were randomly selected by each active Mail user.

The following NOTES.INI parameters were modified as recommended in the NotesBench operator’s manual:

<table>
<thead>
<tr>
<th>Mail-Only Workload</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOG_MAILROUTING=10</td>
</tr>
<tr>
<td>MAILLOGTOEVENTSONLY=1</td>
</tr>
<tr>
<td>MAILUSEPROCESS=0</td>
</tr>
<tr>
<td>MAILUSETHREADS=1</td>
</tr>
<tr>
<td>MAILMAXTHREADS=3</td>
</tr>
<tr>
<td>NSF_BUFFER_POOL_SIZE=12800000</td>
</tr>
<tr>
<td>SERVER_SHOW_PERFORMANCE=1</td>
</tr>
</tbody>
</table>

The following parameters were added to suppress database activity logging after long runs and to capture server console output:

```
NO_FORCE_ACTIVITY_LOGGING=1
DEBUG_OUTFILE=\nbfstb2\lastrun\SUTINFO.log
```

All Notes server tasks were disabled except Replica, Router and Update.

All Notes data files were located on the E - partition. The Notes executables were placed on the C - partition.
Test Procedures

During ramp-up for the Mail-only test, all users were added over a period of less than 60 minutes to accommodate the test environment in which a single Notes client had to support up to 180 users. The system under test ran for an extended period of 9 hours. During the test runs, the tools used to determine steady state included Windows NT’s PERFMON, the Notes Server SHOW command, and the child driver RES files. To confirm steady state, we monitored the number of users, the number of transactions per minute, and pending mail at the SUT. We confirmed steady state when:

- The SUT Notes Server console sustained the peak user load
- Pending mail did not become backlogged, as verified by:
  - Inspection of mail-routing log at the SUT after the test run ended
  - Pending mail snapshots prior to stopping the test run.

To ensure that the test results were reproducible, the tests were repeated, and the results were compared and found to be consistent.
Data

**IBM Netfinity 3500 NotesMark Value for Mail-Only Test**

The Mail workload was run for 9 hours, including ramp-up and steady state. The IBM Netfinity 3500 system demonstrated that it can support 820 concurrent active users with this workload. The NotesMark throughput value was 1,041. Average response time was 2.389 seconds.

![Mail-Only Workload - NotesMark](image)

The Mail workload executes Notes transactions that model a server for mail users at sites that rely only on mail for communication. The resulting capacity metric for a mail-only server is the maximum number of users that can be supported before the average user response time becomes unacceptable.

The mail-only test script models an active user who is reading and sending mail. The script contains an average of 15 minutes of waiting; thus, the average user would execute this script a maximum of four times each hour. For each iteration of the test script, there are 5 documents read, 2 documents updated, 2 documents deleted, 1 view scrolling operation, 1 database opened and closed, 1 view opened and closed, and some miscellaneous operations. In sending messages, each user sends a mail message to NumMessageRecipients no more frequently than every 90 minutes.
**NotesNum Output for Mail-Only Test**

Min Start Time = 12/16/97 07:43:23 AM    Max Stop Time = 12/16/97 04:48:41 AM
Total Test Errors = 0
Total Test Time = 32700 sec
Test Run: Users = 820    NotesMark = 1041    Response Time = 2389 msec (12/16/97 08:43:00 AM to 12/16/97 04:42:00 PM)

The response time satisfies the 5 seconds (5000 msec) NotesBench response time criteria.

---

**Mail-Only Workload - Average Response Time**

**IBM Netfinity 3500**

- Average Response Time = 2.389 Seconds

---

**Mail-Only Workload - Users**

**IBM Netfinity 3500**

- 820 Users
Analysis

Based on PERFMON data analysis from the previous run, we can see that during steady state, the CPU utilization is approximately 28 percent. This indicator shows that the number of concurrent Mail users can be increased by adding more drives to the system. Because of the significant system overhead required to monitor the disk subsystem, disk I/O performance data was not collected for the audit run.
Conclusions

The test results demonstrate that an IBM Netfinity 3500 configured as described within this report can support 820 Mail-only users with a response time well within what the test criteria permit. These results are based on running the IBM Netfinity 3500 as a dedicated Domino server; the addition of other application workloads will affect the number of users supported as well as the response time. Achieving optimum performance in a customer environment is highly dependent upon selecting adequate processor power, memory and disk storage as well as balancing the configuration of that hardware and appropriately tuning the operating system and Domino software.

These results demonstrate that the IBM Netfinity 3500 system provides outstanding price/performance in a hardware platform for the Domino Server environment.
Statement by Auditor

The original “Lotus NotesBench Test Results Report Certification Letter” was signed by Dana M. Thompson, NotesBench Auditor for KMDS Technical Associates, Inc., and is on file at IBM.
Appendix A: Overall Test Setup and Software Versions

Number of Client Systems

Seven driver systems were used. Six of those systems were configured as child drivers (child 1 through child 6). One system was configured as the parent (source driver).

The child systems were IBM PC 365 computers, each configured with one 133MHz Pentium processor. Each child driver was configured with 80MB of memory, one 1.6GB hard disk, and one IBM 100/10 Ethernet PCI Adapter.

The disk configuration used for the child systems is as follows:

C: Partition (1.5GB - FAT) - Windows NT 4.0 Workstation / Notes Domino 4.6a

Number of Server Platforms

One server platform, the IBM Netfinity 3500 with one 233MHz Pentium II processor and 320MB of memory, was benchmarked.

The disk configuration used for the system under test is as follows:

C: Partition (4GB - NTFS) - Windows NT Server Version 4.0 (Boot Partition) and Domino 4.6a executables
E: Partition (4GB - NTFS) - Notes data

The disk configuration used for destination servers 1 through 3 is as follows:

C: Partition (2GB - NTFS) - Windows NT Server Version 4.0 and Notes executables
E: Partition (10GB - NTFS) - Notes data
Network

A single 100Mbps Ethernet LAN segment was used. Two Asante 100BaseT Hubs were used to connect the servers and clients to the LAN segment.

Software Versions

Software versions used on the system under test were as follows:

- Microsoft Windows NT Server Version 4.0 and Service Pack 3
- Lotus Domino Server Release 4.6a
- NotesBench Version 4.6 - Windows/32

Software versions used on the child drivers were as follows:

- Microsoft Windows NT Workstation Version 4.0 and Service Pack 3
- Lotus Notes Client for Windows NT Release 4.6
- NotesBench Version 4.6 - Windows/32

Appendix E: Network Configuration

The standard TCP/IP stack provided by Microsoft Windows NT Server 4.0 was used.

In the system under test, the network adapter speed was changed from the default ‘Auto’ to 100Mbps. This forced the Duplex Mode to ‘Half’.

Under the ‘Advanced’ configuration option, the following three parameters were changed from their default values to double the default value:

- Coalesce Buffers
- Receive Buffers
- Transmit Control Block

At the destination servers, under ‘Advanced’ configuration options for the Ethernet adapter, the following three parameters were changed from their default values to double their default values:

- Coalesce Buffers
- Receive Buffers
- Transmit Control Block
Appendix F: Guidelines for Information Usage

This report is intended for IBM Business Partners, customers, and IBM marketing and technical support personnel. The report may be distributed in accordance with the requirements stated in the Edition notice.
Appendix G: Pricing

The table provides the IBM Estimated Reseller Price to end users for the U.S. only. Actual Reseller prices may vary, and prices may also vary by country. Prices are subject to change without notice. For additional information and current prices, contact your local IBM representative.
