1.0 General Checkout

The advanced diagnostic tests are intended to test *only* IBM (*) products. Non-IBM products, prototype cards, or modified options can give false errors and invalid system responses.

IMPORTANT:

- If more than one error code is displayed, diagnose the first error code first. The cause of the first error code can cause false error codes to be displayed.
- If you do not receive any error codes, see if the error symptom is listed in the "Symptom-to-FRU Index" in topic 12.0.
- If an adapter or device consists of more than one FRU, an error code may be caused by any of the FRUs. Before replacing the adapter or device, remove the FRUs, one by one, to see if the symptoms change.
- The LAN administrator is responsible for making the diagnostic program available to the servicer of medialess systems. Instructions for the LAN administrator are in the *LAN Reference*.
- For carry-in service on medialess systems, a diskette drive compatible to the IBM 1.44MB Diskette Drive (FRU No. 33F8211) and a diskette-drive cable compatible to the IBM Diskette-Drive Cable (FRU No. 27F4912) can be temporarily installed to run the diagnostic program using the Reference Diskette.

Note: Before returning the system to the customer, be sure to remove the diskette drive from the Installed Devices List; then remove the diskette drive and cable from the system.

- Power-off the system and all external devices.
- Check all cables and power cords.
- Make sure there are no diskettes in the drives.
- Power-on all external devices.
- Power-on the system.

Note: Watch the screen for a POST error code. If a POST error code occurs, write down the POST error code, then press F1 to continue.

2.0 Installed Devices List

If an adapter or device is missing from the list, you may have one of the following conditions:

- Your Reference Diskette does not contain the module of code required to support that device.
- The missing device is a 5.25-Inch 360KB External Diskette Drive adapter or another unrecognizable adapter.
- The missing device is defective.
- An adapter is defective.

If none of these conditions apply, go to "Undetermined Problem" in topic 4.0.

Subtopics

- 2.1 Automatic Configuration
- 2.2 Device Type
- 2.3 SCSI Devices
- 2.4 Non-SCSI Devices

2.1 Automatic Configuration

Warning: A customized setup configuration (other than default settings) may exist on the system you are servicing. Running Automatic Configuration may alter those settings. Note the current configuration settings (using the View Configuration option) and verify that the settings are in place when service is complete. (For more information about configuration, refer to the *Hardware Maintenance Reference* manual.)

2.2 Device Type

Run **Automatic Configuration** (see "Automatic Configuration" in topic 2.1 before continuing) and determine which type of device, SCSI or non-SCSI, is missing from the Installed Devices List, in Advanced Diagnostics, then continue with the following steps. (If SCSI and non-SCSI devices both are missing, go to "Undetermined Problem" in topic 4.0.)

2.3 SCSI Devices

The adapter supporting the missing device may be defective. If more than one SCSI adapter is installed, isolate them one at a time.

1. Power-off the system and disconnect all internal and external cables attached to the SCSI adapter.
2. Terminate each SCSI adapter, as required.

Warning: See "Automatic Configuration" in topic 2.1 before continuing.

3. Power-on the system and run **Automatic Configuration**. If the adapter is not on the Installed Devices List, in Advanced Diagnostics, the adapter is defective. If the adapter is on the list, run the adapter diagnostic tests.
4. If the adapter fails the tests, replace it. If the adapter passes the tests, a different adapter may be defective.
5. Reconnect the cables to the SCSI adapter, then terminate the adapter, as required.
6. Go to "Undetermined Problem" in topic 4.0 to find the problem.

2.4 Non-SCSI Devices

Replace the missing device. If that does not correct the problem, go to "Undetermined Problem" in topic 4.0.

Note: If the number of diskette drives shown on the list is incorrect, an error can occur during the tests. Restart the system and select **View Configuration** from the **Set Configuration** menu. Verify that the drive information on the **View Configuration** menu is correct, then run the Diagnostic tests.

3.0 *Power-On Password*

To service a system with an active, unknown power-on password, reverse the speaker connector located on the bus adapter. The change in the connector position is detected, and the password is removed. It is not necessary to move the connector back to its previous position after service.

Power-on the system and leave the assembly shorted until completion of POST. This deactivates the password.

4.0 *Undetermined Problem*

1. Power-off the system.
2. Remove or disconnect one of the following adapters or devices.
 - Non-IBM devices
 - Any external device (modem, printer, or mouse)
 - Any adapter (except the Network Adapter and Bus Adapter)
 - Math coprocessor
 - Fixed disk or diskette drive
 - Memory module kit.
3. Power-on the system.
4. If the symptom remains, repeat steps 1, 2, and 3 until you find the failing adapter or device.
5. If all adapters and devices have been removed or replaced and the problem remains, check the power supply voltages. If the voltages are correct, replace the system board. If the voltages are not correct, replace the power supply.
6. If you are servicing a Local Area Network Station and the problem remains, replace the network adapter. If that does not correct the problem, replace the bus adapter.

5.0 Power Supply Voltages / Fan

If the voltages are not correct, or if the fan is not running, replace the power supply.

Power-off the system. Remove the power supply connectors P7 and P14 from the system board. Power-on the system and check for the voltages listed below. If the voltages are not correct, check the power cord for continuity. If the power cord is good, replace the power supply.

6.0 *Enable and Disable Settings*

To verify that the "Enable" and "Disable" settings are correct, select **Set and View SCSI Device Configuration** from the **Set Configuration** menu, and determine if there are any "Presence Error Reporting" devices listed. The settings must be as follows:

- Devices connected to the system must be set to "Enabled."
- Devices listed but not connected must be set to "Disabled."

Change the settings by pressing the F5 key; then save them by pressing the F10 key.

7.0 *Display Self-Test*

1. Power-off the system unit and display.
2. Disconnect the display signal cable.
3. Power-on the display.
4. Turn the contrast to its maximum position.
5. Turn the brightness control to the center detent position.

The screen should be white with a black margin, as described below (some shading may occur near the edges). If the screen differs, replace the display. If the display passes the test, replace the display adapter or system board.

Replace the keyboard.

10.0 Printer

1. Make sure the printer is properly connected and powered-on.
2. Run the printer self-test.

If the printer self-test does not run correctly, the problem is in the printer. Refer to the printer service manual.

If the printer self-test runs correctly, install a wrap plug on the parallel port and run the advanced diagnostic tests to determine which of the following FRUs is failing:

- System board
- Parallel adapter
- Printer cable.

11.0 Memory

Note: Power-off the system before removing or replacing parts.

00011000 indicates a system board parity check error.

Remove the memory module kit in connector 2. If the problem remains, replace the kit in connector 1; if that does not solve the problem, replace the system board.

If the problem disappears after removing the memory module kit from connector 2, replace the kit; if that does not solve the problem, replace the system board.

00011100 indicates a memory expansion adapter parity check error.

Remove the memory expansion adapters from the expansion slots one at a time until you no longer get a 111 error. (If all of the adapters have been removed and you still have a 00011100 error, replace the system board.)

Remove the memory expansion kits from the adapter that was removed last. Install the kits one at a time until the failure returns.

Replace the kit that caused the error to return; if that does not solve the problem, replace the adapter.

00021500, 00021600 indicates a failing system board memory module kit.

If the error message does not indicate the location of the failing kit, follow the procedure for a 00011000 error, described above.

12.0 Symptom-to-FRU Index

Error symptoms and the FRUs that might be responsible for the failure are listed in the "Symptom- to-FRU index." The most-likely failing FRU is listed first. If you are unable to correct the problem using this index, go to "Undetermined Problem" in topic 4.0.

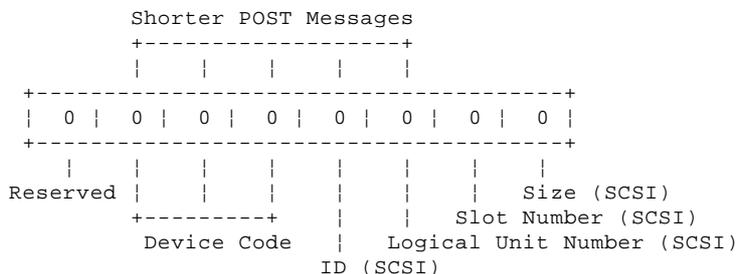

If the system displays an error message and gives an incorrect audio response, start with the FRUs listed for that error message. An "X" in an error message can be any number.

Note: If you are unable to find a symptom or error message, you have an IBM device with its own service manual or a device not supported by the advanced diagnostic tests. Refer to the manual for that device.

How to Read POST Error Messages

POST error messages are displayed on the screen as three, four, five, or eight digits. The error messages that can be displayed as shorter POST messages are highlighted in this index. Some digits will represent different information for SCSI errors versus non-SCSI errors.

The following example shows which digits display the shorter POST error messages and also defines the SCSI information in an eight-digit error message.

All SCSI devices must be set to a different SCSI ID. Duplicate SCSI ID settings can generate a false error message. Use the SCSI ID to determine whether the error message is coming from an internal or an external device.

13.0 How To Use This Parts Catalog

INDEX REFERENCE NUMBERS: Refer to the illustrations for index reference numbers listed in the left margin of the parts listing.

SIMILAR ASSEMBLIES: If two assemblies contain a majority of identical parts, they are broken down on the same list. Parts peculiar to one or the other of the assemblies are listed separately and identified by description.

AR: (As Required) indicates that the quantity is not the same for all machines.

R: (Restricted) indicates that the part has a restricted availability.

INDENTURE the indenture is marked by a series of dots located before the parts description. The indenture indicates the relationship of a part to the next higher assembly. For example:

Indenture Relationship of Parts

- (No dot) Main Assembly
- (One dot) □ Detail parts of a main assembly
- (One dot) □ Subassembly of the main assembly
- (Two dot) □ □ Detail part of a one-dot
 subassembly
- (Two dot) □ □ Subassembly of a one-dot
 subassembly
