

# DIE SETS FOR RIFLE CARTRIDGES

## STANDARD TWO-DIE RIFLE SET

— for use with bottleneck rifle cartridges using jacketed bullets

Sets consist of two basic dies required for rifle reloading. The first die full-length resizes, decaps and expands the case neck. The second die seats the bullet, crimps when desired. Two-die sets are not offered for straight-taper shape cases. They should not be used with cast bullets unless in conjunction with the M-die shown below. Specify cartridge when ordering.

only \$13.50

## STANDARD THREE-DIE RIFLE SET

— specially designed for use with cast bullets

This set is required when loading straight-taper type cartridge cases. It is also available for bottleneck calibers and may be used with either cast or jacketed bullets.

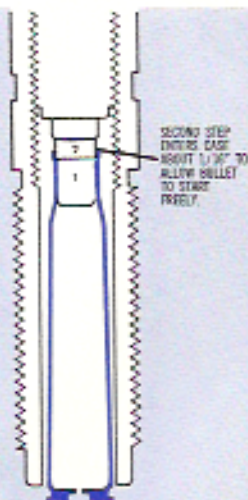

Added advantage of the Three-Die Set is the 2-Step Neck Expanding Die which allows the bullet to enter the case freely. This insures precise bullet pull, and is highly desirable for pin-point accuracy. Complete sets consist of: (1) Full-Length Resizing and Decapping Die; (2) 2-Step Neck Expanding Die; and (3) a Bullet Seating and Crimping Die. Specify cartridge and bullet style when ordering.

## TWO-STEP NECK-EXPANDING DIE "M"

Available for all rifle cases, this die is required when loading cast bullets, and will also improve the accuracy of jacketed bullet reloads. First step expands the neck of the cartridge to slightly under bullet diameter. Second step expands the first 1/16" of the neck to slightly over bullet diameter, allowing the bullet to enter the case freely without cutting lead. Die "M" insures precise bullet pull which is all-important to the accuracy of the load. Specify cartridge and sized bullet diameter when ordering.
