IBM 486 DX4 Power Consumption Values

Fax #40025

Application Note

Author: Scott Pheasant

Introduction

The following tables list the nominal power values, along with their corresponding internal processor speed, for the IBM 486 DX4 microprocessors (both PGA and CQFP packages). The term "Standby" in these tables refers to the microprocessor being placed into both the Suspended and the Stop-Clock states.

TABLE 1. Nominal Active Power Consumption

Voltage/Speed (V/MHz)	Current (mA)	Power Consumption (W)
3.45V		
75 MHz	755	2.60 Watts
100 MHz	920	3.17 Watts

Table 2. Nominal Suspend Mode Power Consumption

Voltage/Speed (V/MHz)	Current (mA)	Power Consumption (W)
3.45 V		
75 MHz	20	.069 Watts
100 MHz	24	.083 Watts

Table 3. Nominal Standby Power Consumption

Voltage/Speed (V/MHz)	Current (mA)	Power Consumption (W)
3.45V	12	.041 Watts
