The Raiha hand priming tool is designed to prime **all** rifle and handgun cartridge cases by utilizing the **RCBS type** slip-in shellholder. The center priming station is the same priming post as the one used in the RCBS automatic priming tool.

The Raiha priming tool, however, is the only priming tool which is adjustable for the depth of the primer seating operation. It is a simple matter to adjust. Loosen the Allen head screw opposite the handle. Make adjustments through priming station hole with Phillips size #2. Retighten set screw. All primers are seated to **exactly** the same **depth** regardless of how much pressure is exerted on the thumb lever.

The power source is a free-turning steel wheel that rolls under the primer push rod when the handle lever is closed. This results in a **very smooth, powerful** operation with a break-over and **feel** while the primer is being seated.

With the shellholder in place, the Raiha Priming Tool is a comfortable, hand-fitting 4.5 inches long.

The Raiha Priming Tool will make further purchases unnecessary because it utilizes RCBS type shellholders which the handloader already owns. In short, with the Raiha Priming Tool you will not only prime **accurately** but **inexpensively** as well.
