<b>Section 5 – AIX SPECfs97_R1 Benchmark Results .....</b>	<b>28</b>
<b>Section 5a – AIX NotesBench Published Results .....</b>	<b>28</b>
<b>Section 6 – AIX Java Benchmarks (SPECjbb2013) Results.....</b>	<b>29</b>
<b>Section 6a – AIX Java Benchmarks (SPECjvm98, SPECjbb2000, SPECjbb2005) Results.....</b>	<b>29</b>
<b>Section 6b - IBM i Java Benchmarks (SPECjbb2005) Published Results .....</b>	<b>30</b>
<b>Section 6c - AIX SPECjAppServer2010 Published Results.....</b>	<b>31</b>
<b>Section 6d - AIX SPECjAppServer2004 Published Results.....</b>	<b>31</b>
<b>Section 7 – SAP Standard Application Benchmarks Published Results .....</b>	<b>32</b>
<b>Section 8 – AIX PeopleSoft Benchmarks Published Results.....</b>	<b>33</b>
<b>Section 9 – AIX Oracle e-Business Suite (eBS) Benchmarks Published Results .....</b>	<b>33</b>
<b>Section 10 – AIX Siebel Benchmarks Published Results .....</b>	<b>34</b>
<b>Section 11 – AIX Sybase Benchmarks Published Results .....</b>	<b>35</b>
<b>Section 12 – AIX Manugistics Benchmarks Published Results.....</b>	<b>35</b>
<b>Section 13 – Linux Published Benchmark Results.....</b>	<b>35</b>
<b>Section 14 – Historical Multiuser Performance.....</b>	<b>40</b>
<b><u>Notes on Performance Benchmarks and Values .....</u></b>	<b>46</b>

## **Performance of IBM UNIX, IBM i and Linux Operating System Servers**

October, 2014

This document contains performance and benchmark results for IBM servers and workstations running the UNIX® (AIX®), IBM i and Linux® operating systems. This includes the IBM Power™ Systems servers, IBM PowerLinux (System p™, System p5™, eServer™ p5, pSeries®, OpenPower® and IBM RS/6000®; BladeCenter® Power Architecture® technology-based blades) and IntelliStation® POWER™ workstations.

**This document contains performance results for systems based on the POWER processor through Oct. 2014.**

Section One of this report includes the SPEC CPU2006 results. SPEC CPU2000 results are presented in Section 1a.

Section Two is multiuser performance. The rPerf, CPW and SPEC\_rate2006 are presented in this section. Multiuser Performance of SPEC CPU2000 along with rPerf and SPECweb99 are presented in Section 2a. Multiuser performance using AIX® V5.2 is presented in Section 2b. Capacity Upgrade on Demand relative performance guidelines are presented in Section 2c. Section 2d of this report includes CPW benchmark information provided for new POWER6 processor-based servers running the IBM i operating system.

Section Three presents the TPC-C version 5 results.

Section Four provides published TPC-H results.

Section Five reflects the published SPECfs97 benchmark results. The NotesBench results to date are presented in Section 5a.

Section Six reflects the published SPECjvm98, SPECjbb2000 and SPECjbb2005 Java™ benchmarks.

Section Seven through Twelve include published application performance benchmarks for SAP, PeopleSoft, Oracle Applications, Seibel, Sybase and Manugistics.

Section Thirteen contains Linux operating system performance results.

Section Fourteen is a historical list of commercial performance estimates for IBM System p™, RS/6000 models and RS/6000 SP™ nodes that have been withdrawn from marketing. IBM has discontinued Relative OLTP results.

All performance measurements for the IBM Power™ Systems, IBM PowerLinux, IBM System p, IBM System p5, IBM eServer p5, IBM eServer pSeries, IBM RS/6000 servers, IntelliStation POWER workstations and BladeCenter blades were made with systems running the AIX operating system unless otherwise indicated to have used Linux. For new and upgraded systems, AIX Version 4.3, AIX 5 or AIX 6 were used. All other systems used previous versions of AIX.

Footnotes used in following tables:

# - System has been announced as withdrawn from marketing; \* - Submitted to SPEC, waiting review; e - estimate; n - new; u - upgrade; N/A - not available; P5 - IBM POWER5™; P5+ - IBM POWER5+™; P6 - IBM POWER6™; P6+ - IBM POWER6+™; P7 - POWER7™; IS - IntelliStation, OP - OpenPower, PPC - PowerPC®

**Changes from September version are highlighted in yellow**

## Section 1 – AIX SPEC CPU2006 Performance

\* CPW is limited to 32 core partition sizes. Larger core configurations were measured with two partitions.

\*\* CPW values for the Power 780 with TurboCore enabled were measured with 8 core partitions.

\*\*\* CPW value for the 32 core Power 795 with TurboCore enabled was measured with 16 core partitions

@ CPW value for 1.8 cores of 2 total cores. 0.2 core is allocated for VIOS

% CPW value for 3.7 cores of 4 total cores. 0.3 core is allocated for VIOS

%% CPW value for 7.5 cores of 8 total cores. 0.5 core is allocated for VIOS

%%% CPW value for 3.5 cores of 4 cores. 0.5 core is allocated for VIOS

# CPW value for 7 cores of 8 total cores. 1 core is allocated for VIOS.

## CPW value for 15 cores of 16 total cores. 1 core is allocated for VIOS.

### CPW value for 30 cores of 32 total cores. 2 cores are allocated for VIOS.

& CPW value for 15 cores of 16 total cores. 1 core is allocated for VIOS.

&& CPW value for 23 cores of 24 total cores. 1 core is allocated for VIOS.

&&& CPW value for 31 cores of 32 total cores. 1 core is allocated for VIOS.

CPW values for non-POWER6 System i™ models may be obtained from

<http://www.ibm.com/systems/i/solutions/perfmgmt/resource.html>.

Note: The rPerf projections are based on different levels of AIX and databases. As a result, actual performance may vary. Estimates have been provided where no historical projections were available.

## **Notes on Performance Benchmarks and Values**

The performance benchmarks and the values shown here were derived using particular, well configured, development-level computer systems. Unless otherwise indicated for a system, the values were derived using external cache if external cache is supported on the system. All performance benchmark values are provided "AS IS" and no warranties or guarantees are expressed or implied by IBM. Actual system performance may vary and is dependent upon many factors including system hardware configuration and software design and configuration. Buyers should consult other sources of information to evaluate the performance of systems they are considering buying and should consider conducting application oriented testing. For additional information about the performance benchmarks, values and systems tested, please contact your IBM local Branch Office or IBM Authorized Reseller or access the following on the Web:

All performance measurements for the IBM Power, IBM PowerLinux, System p, System p5 and eServer p5 servers were made with systems running AIX or AIX 5L operating systems unless otherwise indicated to have used Linux. For new and upgraded systems, the latest versions of AIX were used. All other systems used previous versions of AIX.

The SPEC CPU2006 and SPEC CPU2000 benchmarks were compiled using IBM's high performance C, C++, and FORTRAN compilers for AIX and Linux. For new and upgraded systems, the latest versions of these compilers were used.

The following SPEC benchmarks reflect the performance of the microprocessor, memory architecture and compiler of the tested system:

**SPECint2006** - New SPEC component-level benchmark that measures integer performance. Result is the geometric mean of twelve tests that comprise the CINT2006 benchmark suite.

**SPECint\_base2006** - The result of the same tests in CINT2006 with the same compiler options that must be used in all twelve tests.

**SPECint\_rate2006** - Geometric average of the twelve SPEC rates from the SPEC integer tests (CINT2006).

**SPECint\_rate\_base2006** - The result of the same tests as CINT2006 with the same compiler options that must be used in all twelve tests.

**SPECfp2006** - New SPEC component-level benchmark that measures floating-point performance. Result is the geometric mean of seventeen tests, all written in FORTRAN and C languages, that are included in the CFP2006 benchmark suite.

**SPECfp\_base2006** - The result of the same tests in CFP2006 with the same compiler options that must be used in all seventeen tests.

**SPECfp\_rate2006** - Geometric mean of the seventeen SPEC rates from SPEC floating-point tests (CFP2006).

**SPECfp\_rate\_base2006** - The result of the same tests as CFP2006 with the same compiler options that must be used in all seventeen tests.

**SPECint2000** - SPEC component-level benchmark that measures integer performance. Result is the geometric mean of twelve tests that comprise the CINT2000 benchmark suite. All of these are written in C language except for one which is in C++.

**SPECint\_base2000** - The result of the same tests in CINT2000 with a maximum of four compiler options that must be used in all twelve tests.

**SPECint\_rate2000** - Geometric average of the twelve SPEC rates from the SPEC integer tests (CINT2000).

**SPECint\_rate\_base2000** - The result of the same tests as CINT2000 with a maximum of four compiler options that must be used in all twelve tests.

**SPECfp2000** - SPEC component-level benchmark that measures floating-point performance. Result is the geometric mean of fourteen tests, all written in FORTRAN and C languages, that are included in the CFP2000 benchmark suite.

**SPECfp\_base2000** - The result of the same tests in CFP2000 with a maximum of four compiler options that must be used in all fourteen tests.

**SPECfp\_rate2000** - Geometric mean of the fourteen SPEC rates from SPEC floating-point tests (CFP2000).

**SPECfp\_rate\_base2000** - The result of the same tests as CFP2000 with a maximum of four compiler options that must be used in all fourteen tests.

**SPEC\_OMP2001** - Geometric mean 11 compute intensive parallel workload tests, written in Fortran and C languages.

**SPECweb99** - Number of conforming, simultaneous connections the Web server can support using a predefined workload. The SPECweb99 test harness emulates clients sending the HTTP requests in the workload over slow Internet connections to the Web server. The Web server software is Zeus from Zeus Technology Ltd.

**SPECweb2005** - Emulates users sending browser requests over broadband Internet connections to a Web server. It provides three new workloads: a banking site (HTTPS), an e-commerce site (HTTP/HTTPS mix); and a support site (HTTP).

**SPECweb99\_SSL** - Number of conforming, simultaneous SSL encryption/decryption connections the Web server can support using a predefined workload. The Web server software is Zeus from Zeus Technology Ltd.

**SPECjvm99** - Contains eight different tests. Each test measures the time it takes to load the program, verify the class files, compile on the fly if a JIT compiler is used, and execute the test. A geometric mean is used to compute a composite score. Test scores are normalized against a reference machine. Higher scores indicate better performance.

**SPECjbb2000** - Expressed in operations per second; evaluates the performance of servers running typical Java business applications; it represents an order processing application for a wholesale supplier. The benchmark can be used to evaluate performance of hardware and software aspects of Java Virtual Machine (JVM) servers.

**SPECjbb2005** - Expressed in bops and bops/JVM; evaluates the performance of servers running typical Java business applications; it represents an order processing application for a wholesale supplier. The benchmark can be used to evaluate performance of hardware and software aspects of Java Virtual Machine (JVM) servers.

**SPECcfs97\_R1** - Measures speed and request-handling capabilities of NFS (network file server) computers.

**SPECjAppServer2004** - Measures the performance of Java Enterprise Application Servers using a subset of J2EE APIs in a complete end-to-end Web application.

**SPECjEnterprise2010** - The SPECjEnterprise2010 benchmark is a full system benchmark which allows performance measurement and characterization of Java EE 5.0 servers and supporting infrastructure such as JVM, Database, CPU, disk and servers.

**The following Transaction Processing Council (TPC) benchmarks reflect the performance of the microprocessor, memory subsystem, disk subsystem and some portions of the network:**

**tpmC** - TPC Benchmark C throughput measured as the average number of transactions processed per minute during a valid TPC-C configuration run of at least twenty minutes.

**\$/tpmC** - TPC Benchmark C price-performance ratio reflects the estimated five year total cost of ownership for system hardware, software and maintenance and is determined by dividing such estimated total cost by the tpmC for the system.

**QppH** - The power metric of TPC-H and is based on a geometric mean of the 17 TPC-H queries, the insert test and the delete test. It measures the ability of the system to give a single user the best possible response time by harnessing all available resources. QppH is scaled based on database size from 30GB to 1TB.

**QthH** - The throughput metric of TPC-H and is a classical throughput measure characterizing the ability of the system to support a multiuser workload in a balanced way. A number of query users is chosen, each of which must execute the full set of 17 queries in a different order. In the background, there is an update stream that runs a series of insert/delete operations. QthH is scaled based on the database size from 30GB to 1TB.

**QphH** is the geometric mean of the power tests (QppH) and the throughput tests (QthH).

**\$/QphH** - The price/performance metric for the TPC-H benchmark where QphH is the geometric mean of QppH and QthH. The price is the five year cost of ownership for the tested configuration and includes maintenance and software support.

## **Notes on Performance Estimates**

rPerf (Relative Performance) is an estimate of commercial processing performance relative to other IBM UNIX systems. It is derived from an IBM analytical model which uses characteristics from IBM internal workloads, TPC and SPEC benchmarks. The rPerf model is not intended to represent any specific public benchmark results and should not be reasonably used in that way. The model simulates some of the system operations such as CPU, cache and memory. However, the model does not simulate disk or network I/O operations.

rPerf estimates are calculated based on systems with the latest levels of AIX and other pertinent software at the time of system announcement. Actual performance will vary based on application and configuration specifics. The IBM eServer pSeries 640 is the baseline reference system and has a value of 1.0. Although rPerf may be used to approximate relative IBM UNIX commercial processing performance, actual system performance may vary and is dependent upon many factors including system hardware configuration and software design and configuration. Note that the rPerf methodology used for the POWER6 systems is identical to that used for the POWER5 systems. Variations in incremental system performance may be observed in commercial workloads due to changes in the underlying system architecture.

Commercial Processing Workload (CPW) is a relative measure of performance of processors running the IBM i operating system. Performance in client environments may vary. The value is based on maximum configurations. More performance information is available in the Performance Capabilities Reference at:

<http://www.ibm.com/systems/i/solutions/perfmgmt/resource.html> .

All performance estimates are provided "AS IS" and no warranties or guarantees are expressed or implied by IBM. Buyers should consult other sources of information, including system benchmarks, and application sizing guides to evaluate the performance of a system they are considering buying. For additional information about rPerf and CPW, contact your local IBM office or IBM authorized reseller.

IBM withdrew Relative OLTP (ROLTP). Starting June 2001, IBM will not publish/update ROLTP results. ROLTP results of systems that are withdrawn from the market are left in Section 14, Historical Multiuser Performance.

## **Application Benchmarks**

**SAP** - Benchmark overview information: <http://www.sap.com/benchmark/>

**PeopleSoft** - To get information on PeopleSoft benchmarks, contact PeopleSoft directly or the PeopleSoft/IBM International Competency Center in San Mateo, CA.

**Oracle Applications** - Benchmark overview information:  
[http://www.oracle.com/apps\\_benchmark/html/results.html](http://www.oracle.com/apps_benchmark/html/results.html)

**NotesBench** - The driver program to test various aspects of Lotus® Notes®. It is designed to execute the commands in customized workload scripts, simulating Notes client actions. Source: <http://www.notesbench.org/>.

**Total Users** - Number of active users supported in the workload, each producing approximately one transaction/minute.

**TPM** - Transactions per minute (NotesMark)

**Average Response Time** - Average time for a transaction to be completed for an average user action.

**\$/User** - Total cost of the hardware and software including discounts quoted by a supplier.
