

Am486® DX2

High-Performance, Clock-Doubled, 32-Bit Microprocessor

The following should be used as additional information to corresponding sections of the current data sheet (order# 17914). The Am486DX2 microprocessor has been extended to include 66 MHz.

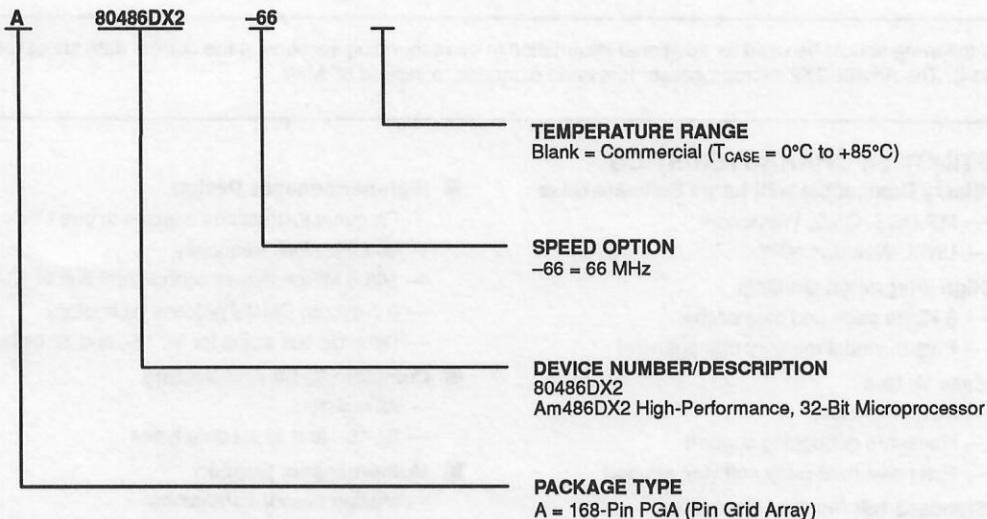

DISTINCTIVE CHARACTERISTICS

- **Binary Compatible with Large Software Base**
 - MS-DOS, OS/2, Windows™
 - UNIX, Windows NT™
- **High Integration On-Chip**
 - 8-Kbyte code and data cache
 - Paged, virtual memory management
- **Easy To Use**
 - Built-in self test
 - Hardware debugging support
 - Extensive third-party software support
- **Standard 168-Pin PGA Package**
- **IEEE 1149.1 Boundary Scan Compatibility on all versions**

- **High-performance Design**
 - Frequent instructions execute in one clock
 - 66-MHz clock frequency
 - 105.6 Million bytes/second burst bus at 33 MHz
 - 0.7-micron CMOS process technology
 - Dynamic bus sizing for 8-, 16-, and 32-bit buses
- **Complete 32-bit Architecture**
 - All registers
 - 8-, 16-, and 32-bit data types
- **Multiprocessor Support**
 - Multiprocessor instructions
 - Cache consistency
 - Support for second-level cache
- **Pin-for-Pin Replacement of the i486DX**

ORDERING INFORMATION**Standard Products**

AMD standard products are available in several packages and operating ranges. The order number (Valid Combination) is formed by a combination of the elements below.

| Valid Combinations | | |
|--------------------|----------|-----|
| A | 80486DX2 | -66 |

Valid Combinations

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local AMD sales office to confirm availability of specific valid combinations and to check on newly released combinations.

ABSOLUTE MAXIMUM RATINGS

| | | |
|--|-------|----------------------------|
| Case Temperature under Bias | | -65°C to +110°C |
| Storage Temperature | | -65°C to +150°C |
| Voltage on any pin with respect to ground | | -0.5 V to V_{CC} + 0.5 V |
| Supply voltage with respect to V_{SS} | | -0.5 V to +6.5 V |

Stresses above those listed under Absolute Maximum Ratings may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to Absolute Maximum Ratings for extended periods may affect device reliability.

OPERATING RANGES**Commercial (C) Devices**

| | | |
|------------|-------|--------------|
| T_{CASE} | | 0°C to +85°C |
| V_{CC} | | 5 V ± 5% |

Operating ranges define those limits between which the functionality of the device is guaranteed.

DC CHARACTERISTICS over COMMERCIAL operating ranges

Notes:

1. This parameter is measured at:
Address, Data, \overline{BE} n 4.0 mA
Definition, Control 5.0 mA
2. This parameter is measured at:
Address, Data, \overline{BE} n -1.0 mA
Definition, Control -0.9 mA
3. Typical supply current
1050 mA @ 66 MHz
4. This parameter is for inputs without internal pull-ups or pull-downs and $0 \leq V_{IN} \leq V_{CC}$.
5. This parameter is for inputs with internal pull-downs and $V_{IH} = 2.4 \text{ V}$.
6. This parameter is for inputs with internal pull-ups and $V_{IL} = 0.45 \text{ V}$.
7. Not 100% tested.
8. The I_{CCF} specification is a target value for current requirements when the \overline{UP} input is active, that is, when the Am486DX is used with an OverDrive Processor. It has not been tested.

Notes:

1. Not 100% tested. Guaranteed by design characterization.
2. Specifications assume $C_L = 50 \text{ pF}$. I/O Buffer model must be used to determine delays due to loading (trace and component). First Order I/O buffer models for the Am486 CPU are available.
3. The minimum Am486DX2 CPU output valid delays are hold times provided to external circuitry.
4. A reset pulse width of 15 CLK cycles is required for warm resets. Power up resets require RESET to be asserted for at least 1 ms after V_{CC} and CLK are stable.

Notes:

1. Rise/Fall times are measured between 0.8 V and 2.0 V. Rise/Fall times can be relaxed by 1 ns per 10-ns increase in TCK period.
2. TCK period \geq CLK period.
3. Parameter measured from TCK.
4. Boundary Scan AC Specifications in the above table are target values. They have not been characterized. Therefore, they are subject to change.

Package Thermal Specifications

The Am486DX2-66 microprocessor is specified for operation when T_{case} (the case temperature) is within the range of 0°C to +85°C. T_{case} can be measured in any environment to determine whether the Am486DX2-66 microprocessor is within specified operating range. The case temperature should be measured at the center of the top surface opposite the pins.

The ambient temperature (T_A) is guaranteed as long as T_{case} is not violated. The ambient temperature can be calculated from θ_{JC} and θ_{JA} and from the following equations:

$$T_J = T_C + P \cdot \theta_{JC}$$

$$T_A = T_J - P \cdot \theta_{JA}$$

$$T_{CASE} = T_A + P \cdot [\theta_{JA} - \theta_{JC}]$$

where:

T_J , T_A , T_{CASE} = Junction, Ambient, and Case Temperature.

θ_{JC} , θ_{JA} = Junction-to-Case and Junction-to-Ambient Thermal Resistance, respectively.

P = Maximum Power Consumption

The values for θ_{JC} and θ_{JA} are given in Table 1 for the 1.75 sq. in., 168-pin, ceramic PGA.

Table 2 shows the T_A allowable (without exceeding T_{case}) at various airflows and operating frequencies (CLOCK). Note that T_A is greatly improved by attaching "fins" or a "heat sink" to the package. Conventional heat sink dimensions are shown in Figure 1. P (the maximum power consumption) is calculated by using the maximum I_{CC} at 5 V as tabulated in the DC Characteristics.
