

# LM340/LM78XX Series

## 3-Terminal Positive Regulators

### General Description

The LM140/LM340A/LM340/LM78XXC monolithic 3-terminal positive voltage regulators employ internal current-limiting, thermal shutdown and safe-area compensation, making them essentially indestructible. If adequate heat sinking is provided, they can deliver over 1.0A output current. They are intended as fixed voltage regulators in a wide range of applications including local (on-card) regulation for elimination of noise and distribution problems associated with single-point regulation. In addition to use as fixed voltage regulators, these devices can be used with external components to obtain adjustable output voltages and currents.

Considerable effort was expended to make the entire series of regulators easy to use and minimize the number of external components. It is not necessary to bypass the output, although this does improve transient response. Input bypassing is needed only if the regulator is located far from the filter capacitor of the power supply.

The 5V, 12V, and 15V regulator options are available in the steel TO-3 power package. The LM340A/LM340/LM78XXC series is available in the TO-220 plastic power package, and the LM340-5.0 is available in the SOT-223 package, as well as the LM340-5.0 and LM340-12 in the surface-mount TO-263 package.

### Features

- Complete specifications at 1A load
- Output voltage tolerances of  $\pm 2\%$  at  $T_j = 25^\circ\text{C}$  and  $\pm 4\%$  over the temperature range (LM340A)
- Line regulation of 0.01% of  $V_{OUT}/V$  of  $\Delta V_{IN}$  at 1A load (LM340A)
- Load regulation of 0.3% of  $V_{OUT}/A$  (LM340A)
- Internal thermal overload protection
- Internal short-circuit current limit
- Output transistor safe area protection
- P+ Product Enhancement tested

### Typical Applications

#### Fixed Output Regulator

00778101

\*Required if the regulator is located far from the power supply filter.

\*\*Although no output capacitor is needed for stability, it does help transient response. (If needed, use 0.1  $\mu\text{F}$ , ceramic disc).

#### Adjustable Output Regulator

00778102

$V_{OUT} = 5V + (5V/R1 + I_Q) R2$   $5V/R1 > 3 I_Q$   
load regulation ( $L_r$ )  $\approx [(R1 + R2)/R1]$  ( $L_r$  of LM340-5).

#### Current Regulator

00778103

$$I_{OUT} = \frac{V_{2-3}}{R1} + I_Q$$

$\Delta I_Q = 1.3 \text{ mA}$  over line and load changes.

| V <sub>IN</sub>                        | Input Voltage Required to Maintain Line Regulation  | T <sub>J</sub> = 25°C, I <sub>O</sub> ≤ 1A            | 7.5                               |     |     | 14.6                                 |     |     | 17.7                                 |     |     | V       |

**Note 1:** Absolute Maximum Ratings are limits beyond which damage to the device may occur. Operating Conditions are conditions under which the device functions but the specifications might not be guaranteed. For guaranteed specifications and test conditions see the Electrical Characteristics.

**Note 2:** The maximum allowable power dissipation at any ambient temperature is a function of the maximum junction temperature for operation (T<sub>JMAX</sub> = 125°C or 150°C), the junction-to-ambient thermal resistance (θ<sub>JA</sub>), and the ambient temperature (T<sub>A</sub>). P<sub>DMAX</sub> = (T<sub>JMAX</sub> - T<sub>A</sub>)/θ<sub>JA</sub>. If this dissipation is exceeded, the die temperature will rise above T<sub>JMAX</sub> and the electrical specifications do not apply. If the die temperature rises above 150°C, the device will go into thermal shutdown. For the TO-3 package (K, KC), the junction-to-ambient thermal resistance (θ<sub>JA</sub>) is 39°C/W. When using a heatsink, θ<sub>JA</sub> is the sum of the 4°C/W junction-to-case thermal resistance (θ<sub>JC</sub>) of the TO-3 package and the case-to-ambient thermal resistance of the heatsink. For the TO-220 package (T), θ<sub>JA</sub> is 54°C/W and θ<sub>JC</sub> is 4°C/W. If SOT-223 is used, the junction-to-ambient thermal resistance is 174°C/W and can be reduced by a heatsink (see Applications Hints on heatsinking).

If the TO-263 package is used, the thermal resistance can be reduced by increasing the PC board copper area thermally connected to the package: Using 0.5 square inches of copper area, θ<sub>JA</sub> is 50°C/W; with 1 square inch of copper area, θ<sub>JA</sub> is 37°C/W; and with 1.6 or more inches of copper area, θ<sub>JA</sub> is 32°C/W.

**Note 3:** ESD rating is based on the human body model, 100 pF discharged through 1.5 kΩ.

**Note 4:** All characteristics are measured with a 0.22 μF capacitor from input to ground and a 0.1 μF capacitor from output to ground. All characteristics except noise voltage and ripple rejection ratio are measured using pulse techniques (t<sub>w</sub> ≤ 10 ms, duty cycle ≤ 5%). Output voltage changes due to changes in internal temperature must be taken into account separately.

**Note 5:** Military datasheets are available upon request. At the time of printing, the military datasheet specifications for the LM140K-5.0/883, LM140K-12/883, and LM140K-15/883 complied with the min and max limits for the respective versions of the LM140. The LM140H and LM140K may also be procured as JAN devices on slash sheet JM38510/107.

| $\Delta V_O/\Delta T$   | Average Temperature Coefficient of Output Voltage |           | $I_O = 5.0\text{ mA}$   |   | 0.8  |     | $\text{mV}/^{\circ}\text{C}$ |

**Note 6:** All characteristics are measured with a  $0.22\text{ }\mu\text{F}$  capacitor from input to ground and a  $0.1\text{ }\mu\text{F}$  capacitor from output to ground. All characteristics except noise voltage and ripple rejection ratio are measured using pulse techniques ( $t_w \leq 10\text{ ms}$ , duty cycle  $\leq 5\%$ ). Output voltage changes due to changes in internal temperature must be taken into account separately.
