description

The TMS45160 series are high-speed, 4194304-bit dynamic random-access memories organized as 262144 words of 16 bits each. The TMS45160P series are high-speed, low-power, self-refresh 4194304-bit dynamic random-access memories organized as 262144 words of 16 bits each. They employ state-of-the-art EPIC™ (Enhanced Performance Implanted CMOS) technology for high performance, reliability, and low power at low cost.

These devices feature maximum $\overline{\text{RAS}}$ access times of 60 ns, 70 ns, and 80 ns. Maximum power dissipation is as low as 770 mW operating and 11 mW standby on 80-ns devices. All inputs and outputs, including clocks, are compatible with Series 74 TTL. All addresses and data-in lines are latched on chip to simplify system design. Data out is unlatched to allow greater system flexibility.

The TMS45160 and TMS45160P are each offered in a 40-lead plastic surface-mount SOJ package (DZ suffix) and a 40/44-lead plastic surface-mount small-outline (TSOP) package (DGE suffix). These packages are characterized for operation from 0°C to 70°C.

EPIC is a trademark of Texas Instruments Incorporated.

operation

dual $\overline{CAS}$

Two $\overline{CAS}$ pins ($\overline{LCAS}$–$\overline{UCAS}$) are provided to give independent control of the 16 data I/O pins (DQ0–DQ15) with $\overline{LCAS}$ corresponding to DQ0–DQ7 and $\overline{UCAS}$ corresponding to DQ8–DQ15. For read or write cycles, the column address is latched on the first $\overline{xCAS}$ falling edge. Each $\overline{xCAS}$ going low enables its corresponding DQx pins with data associated with the column address latched on the first falling $\overline{xCAS}$ edge. All address setup and hold parameters are referenced to the first falling $\overline{xCAS}$ edge.The delay time from $\overline{xCAS}$ low to valid data out (see parameter t_{CAC}) is measured from each individual $\overline{xCAS}$ to its corresponding DQx pins.

In order to latch in a new column address, both $\overline{xCAS}$ pins must be brought high. The column precharge time (see parameter t_{CP}) is measured from the last $\overline{xCAS}$ rising edge to the first falling $\overline{xCAS}$ edge of the new cycle. Keeping a column address valid while toggling $\overline{xCAS}$ requires a minimum setup time, t_{CLCH}. During t_{CLCH}, at least one $\overline{xCAS}$ must be brought low before the other $\overline{xCAS}$ is taken high.

For early-write cycles, the data is latched on the first falling edge of $\overline{xCAS}$. Only the DQs that have the corresponding $\overline{xCAS}$ low are written into. Each $\overline{xCAS}$ must meet t_{CAS} minimum in order to ensure writing into the storage cell. In order to latch a new address and new data, both $\overline{xCAS}$ pins must go high and meet t_{CP}.

enhanced page mode

Page-mode operation allows faster memory access by keeping the same row address while selecting random column addresses. The time for row-address setup and hold and address multiplex is eliminated. The maximum number of columns that can be accessed is determined by the maximum $\overline{RAS}$ low time and the $\overline{xCAS}$ page-mode cycle time used. With minimum $\overline{xCAS}$ page cycle time, all 512 columns specified by column addresses A0 through A8 can be accessed without intervening $\overline{RAS}$ cycles.

Unlike conventional page-mode DRAMs, the column-address buffers in this device are activated on the falling edge of $\overline{RAS}$. The buffers act as transparent or flow-through latches while $\overline{xCAS}$ is high. The first falling edge of $\overline{xCAS}$ latches the column addresses. This feature allows the devices to operate at a higher data bandwidth than conventional page-mode parts because data retrieval begins as soon as column address is valid rather than when $\overline{xCAS}$ transitions low. This performance improvement is referred to as enhanced page mode. A valid column address can be presented immediately after t_{RAH} (row-address hold time) has been satisfied, usually well in advance of the falling edge of $\overline{xCAS}$. In this case, data is obtained after t_{CAC} max (access time from $\overline{xCAS}$ low) if t_{AA} max (access time from column address) has been satisfied. In the event that column addresses for the next page cycle are valid at the time $\overline{xCAS}$ goes high, minimum access time for the next cycle is determined by t_{CPA} (access time from rising edge of the last $\overline{xCAS}$).

address (A0–A8)

Eighteen address bits are required to decode 1 of 262144 storage cell locations. Nine row-address bits are set up on A0 through A8 and latched onto the chip by $\overline{RAS}$. Then, nine column-address bits are set up on A0 through A8 and latched onto the chip by the first $\overline{xCAS}$. All addresses must be stable on or before the falling edge of $\overline{RAS}$ and $\overline{xCAS}$. $\overline{RAS}$ is similar to a chip enable in that it activates the sense amplifiers as well as the row decoder. $\overline{xCAS}$ is used as a chip select, activating its corresponding output buffer and latching the address bits into the column-address buffers.

write enable ($\overline{W}$)

The read or write mode is selected through $\overline{W}$. A logic high on $\overline{W}$ selects the read mode and a logic low selects the write mode. $\overline{W}$ can be driven from the standard TTL circuits without a pullup resistor. The data input lines are disabled when the read mode is selected. When $\overline{W}$ goes low prior to $\overline{xCAS}$ (early write), data out remains in the high-impedance state for the entire cycle, permitting a write operation with $\overline{OE}$ grounded.

data in (DQ0–DQ15)

Data is written during a write or read-modify-write cycle. Depending on the mode of operation, the falling edge of $\overline{\text{xCAS}}$ or $\overline{\text{W}}$ strobes data into the on-chip data latch. In an early-write cycle, $\overline{\text{W}}$ is brought low prior to $\overline{\text{xCAS}}$ and the data is strobed in by the first occurring $\overline{\text{xCAS}}$ with setup and hold times referenced to data in. In a delayed-write or read-modify-write cycle, $\overline{\text{xCAS}}$ is already low and the data is strobed in by $\overline{\text{W}}$ with setup and hold times referenced to data in. In a delayed-write or read-modify-write cycle, $\overline{\text{OE}}$ must be high to bring the output buffers to the high-impedance state prior to impressing data on the I/O lines.

data out (DQ0–DQ15)

The 3-state output buffer provides direct TTL compatibility (no pullup resistor required) with a fanout of two Series 74 TTL loads. Data out is the same polarity as data in. The output is in the high-impedance (floating) state until $\overline{\text{xCAS}}$ and $\overline{\text{OE}}$ are brought low. In a read cycle, the output becomes valid after the access-time interval t_{CAC} (which begins with the negative transition of $\overline{\text{xCAS}}$) as long as t_{RAC} and t_{AA} are satisfied.

output enable ($\overline{\text{OE}}$)

$\overline{\text{OE}}$ controls the impedance of the output buffers. When $\overline{\text{OE}}$ is high, the buffers remain in the high-impedance state. Bringing $\overline{\text{OE}}$ low during a normal cycle activates the output buffers, putting them in the low-impedance state. It is necessary for both $\overline{\text{RAS}}$ and $\overline{\text{xCAS}}$ to be brought low for the output buffers to go into the low-impedance state. They remain in the low-impedance state until either $\overline{\text{OE}}$ or $\overline{\text{xCAS}}$ is brought high.

$\overline{\text{RAS}}$-only refresh

A refresh operation must be performed at least once every 8 ms (64 ms for TMS45160P) to retain data. This can be achieved by strobing each of the 512 rows (A0–A8). A normal read or write cycle refreshes all bits in each row that is selected. A $\overline{\text{RAS}}$-only operation can be used by holding all $\overline{\text{xCAS}}$ at the high (inactive) level, conserving power as the output buffers remain in the high-impedance state. Externally generated addresses must be used for a $\overline{\text{RAS}}$-only refresh.

hidden refresh

Hidden refresh can be performed while maintaining valid data at the output pin. This is accomplished by holding $\overline{\text{xCAS}}$ at V_{IL} after a read operation and cycling $\overline{\text{RAS}}$ after a specified precharge period, similar to a $\overline{\text{RAS}}$-only refresh cycle. The external address is ignored and the refresh address is generated internally.

$\overline{\text{xCAS}}$-before-$\overline{\text{RAS}}$ (xCBR) refresh

xCBR refresh is utilized by bringing at least one $\overline{\text{xCAS}}$ low earlier than $\overline{\text{RAS}}$ (see parameter t_{CSR}) and holding it low after $\overline{\text{RAS}}$ falls (see parameter t_{CHR}). For successive xCBR refresh cycles, $\overline{\text{xCAS}}$ can remain low while cycling $\overline{\text{RAS}}$. The external address is ignored and the refresh address is generated internally.

A low-power battery-backup refresh mode that requires less than 500-μA refresh current is available on the TMS45160P. Data integrity is maintained using xCBR refresh with a period of 125 μs holding $\overline{\text{RAS}}$ low for less than 1 μs. To minimize current consumption, all input levels must be at CMOS levels ($V_{IL} \leq 0.2$ V, $V_{IH} \geq V_{CC} - 0.2$ V).

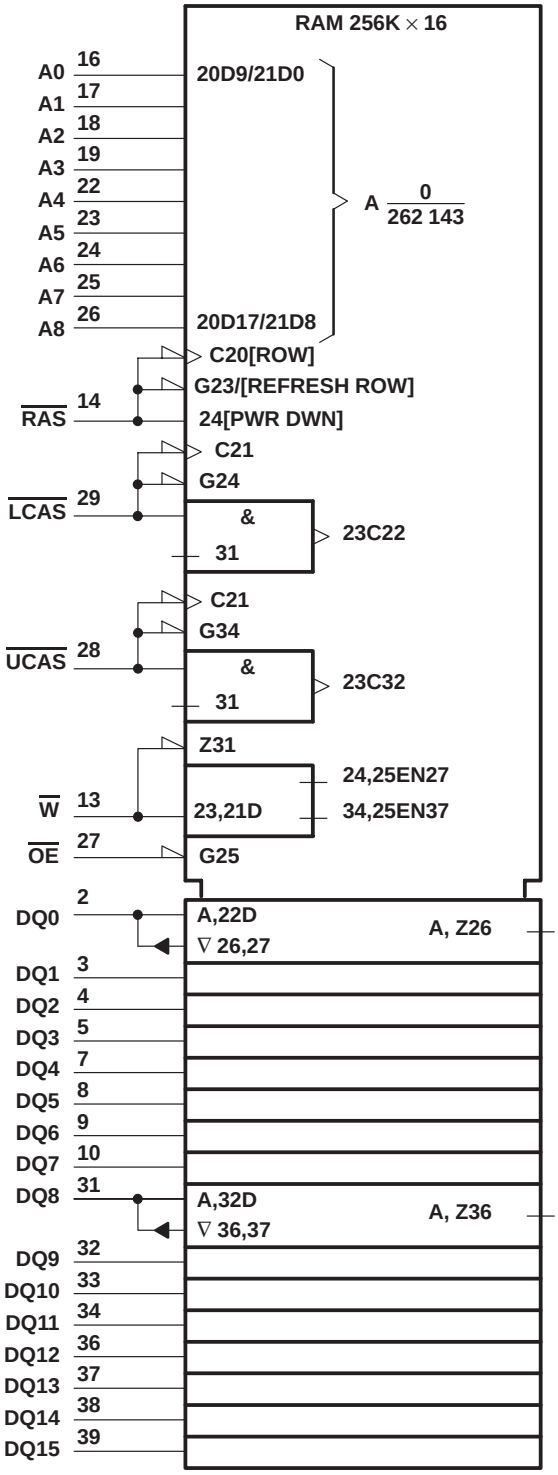
self refresh (TMS45160P)

The self-refresh mode is entered by dropping $\overline{\text{xCAS}}$ low prior to $\overline{\text{RAS}}$ going low. Then $\overline{\text{xCAS}}$ and $\overline{\text{RAS}}$ are both held low for a minimum of 100 μs. The chip is refreshed internally by an on-board oscillator. No external address is required since the CBR counter is used to keep track of the address. To exit the self-refresh mode, both $\overline{\text{RAS}}$ and $\overline{\text{xCAS}}$ are brought high to satisfy t_{CHS}. Upon exiting the self-refresh mode, a burst refresh (refresh a full set of row addresses) must be executed before continuing with normal operation. This ensures that the DRAM is fully refreshed.

power up

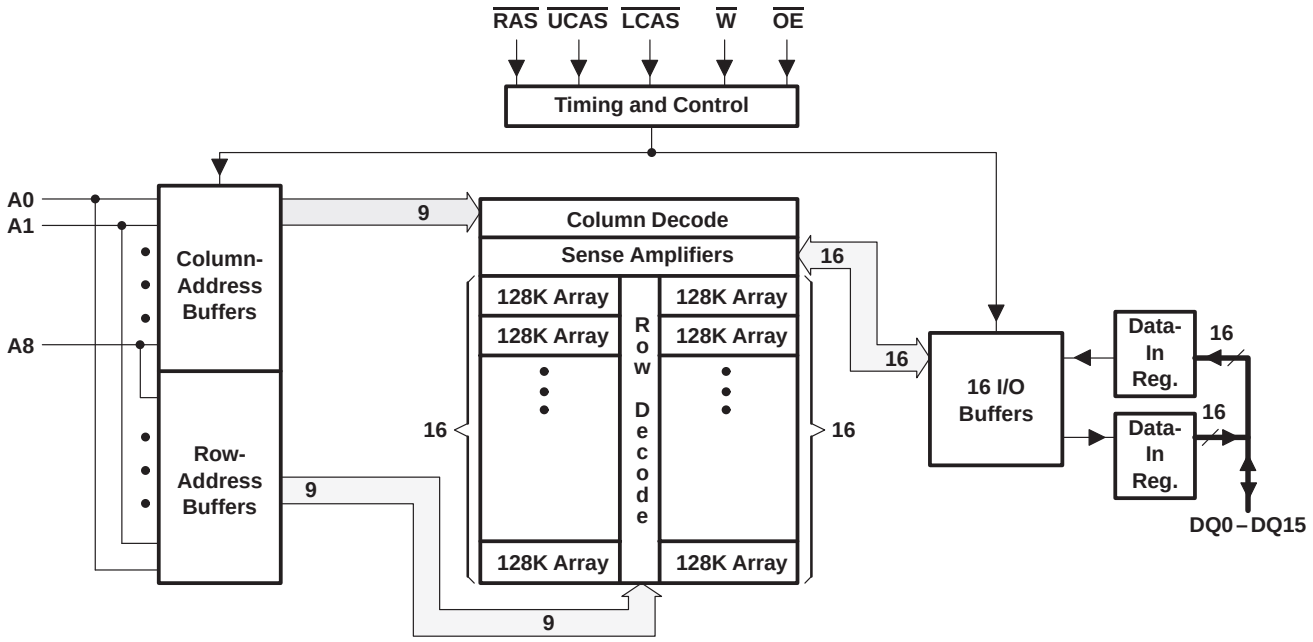
To achieve proper device operation, an initial pause of 200 μs followed by a minimum of eight $\overline{RAS}$ cycles is required after power up to the full V_{CC} level.These eight initialization cycles must include at least one refresh ($\overline{RAS}$-only or $\overline{xCBR}$) cycle.

logic symbol†



† This symbol is in accordance with ANSI/IEEE Std 91-1984 and IEC Publication 617-12.
The pin numbers shown are for the DZ package.

functional block diagram



absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage range, V_{CC} . . . . . – 1 V to 7 V
Voltage range on any pin (see Note 1) . . . . . – 1 V to 7 V
Short-circuit output current . . . . . 50 mA
Power dissipation . . . . . 1 W
Operating free-air temperature range, T_A . . . . . 0°C to 70°C
Storage temperature range, T_{stg} . . . . . – 55°C to 150°C

† Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltage values are with respect to V_{SS}.

NOTES: A. In order to hold the address latched by the first $\overline{\text{xCAS}}$ going low, the parameter t_{CLCH} must be met.
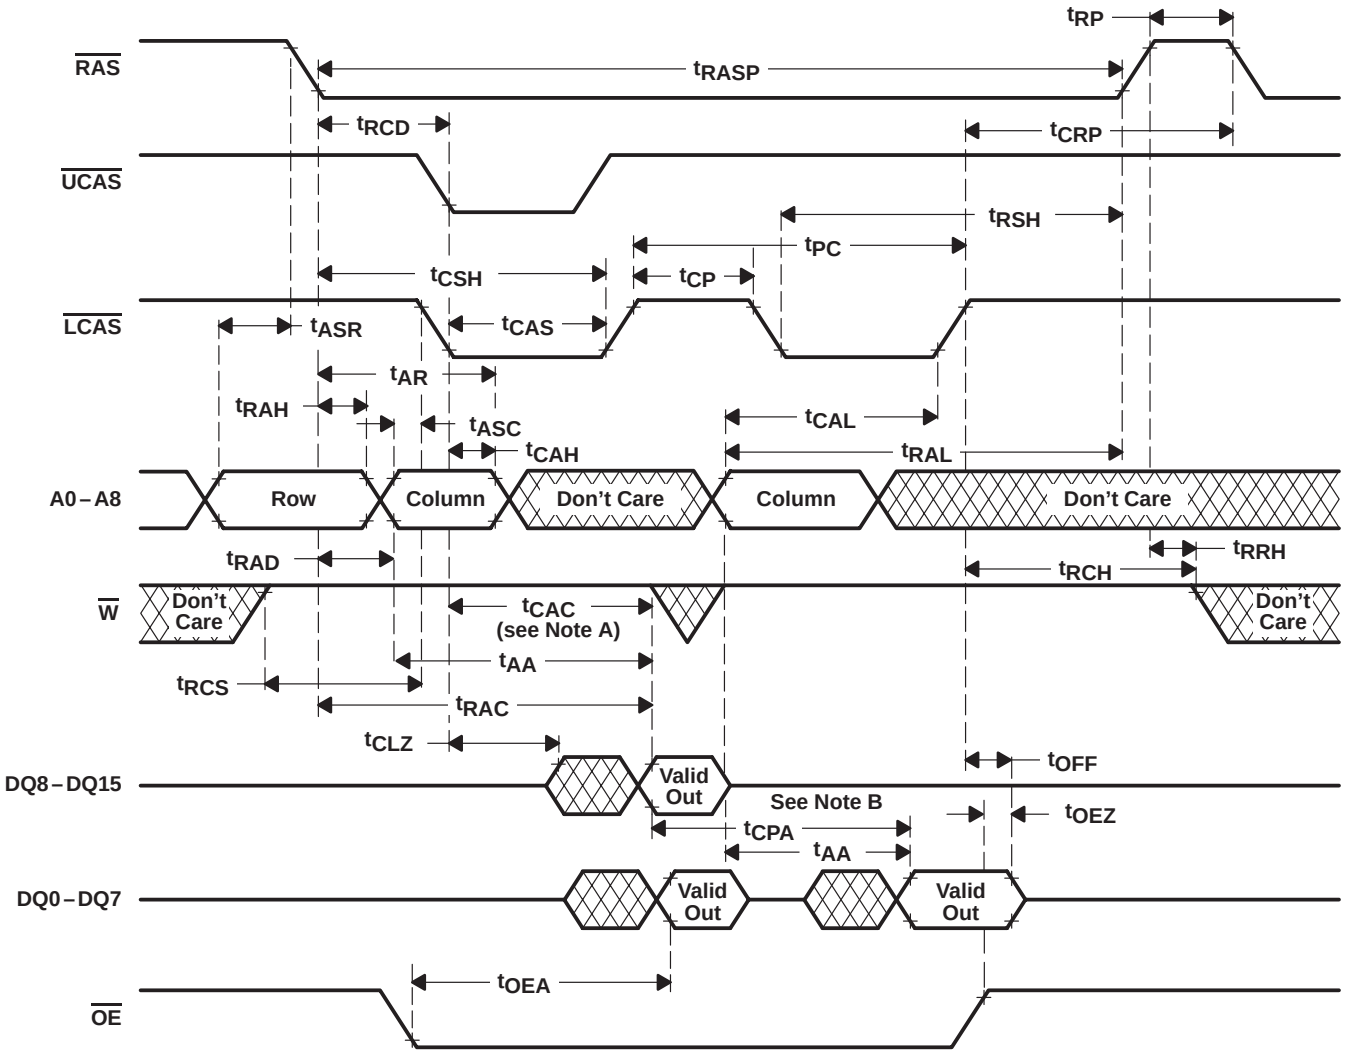
B. Output can go from the high-impedance state to an invalid-data state prior to the specified access time.
C. $\overline{\text{xCAS}}$ order is arbitrary.

Figure 5. Read-Modify-Write-Cycle Timing

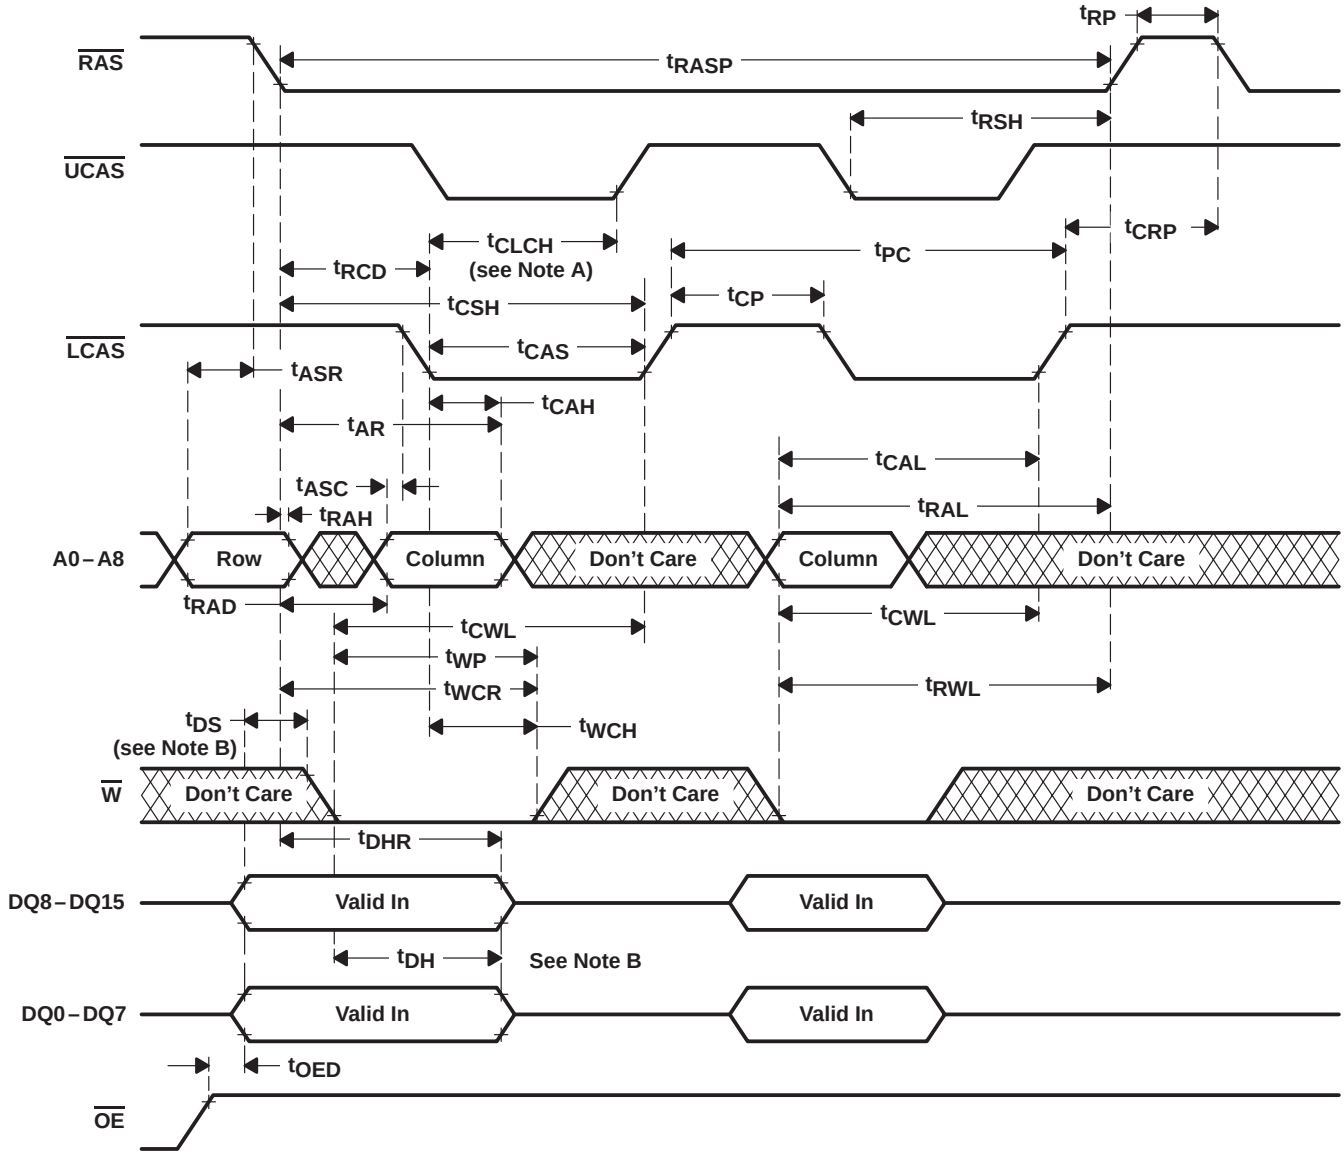
PARAMETER MEASUREMENT INFORMATION



NOTES: A. t_{CAC} is measured from $\overline{xCAS}$ to its corresponding DQx.
B. Access time is t_{CPA} or t_{AA} dependent.
C. A write cycle or read-modify-write cycle can be mixed with the read cycles as long as the write and read-modify-write timing specifications are not violated.
D. $\overline{xCAS}$ order is arbitrary.
E. Output can go from the high-impedance state to an invalid-data state prior to the specified access time.

Figure 6. Enhanced-Page-Mode Read-Cycle Timing

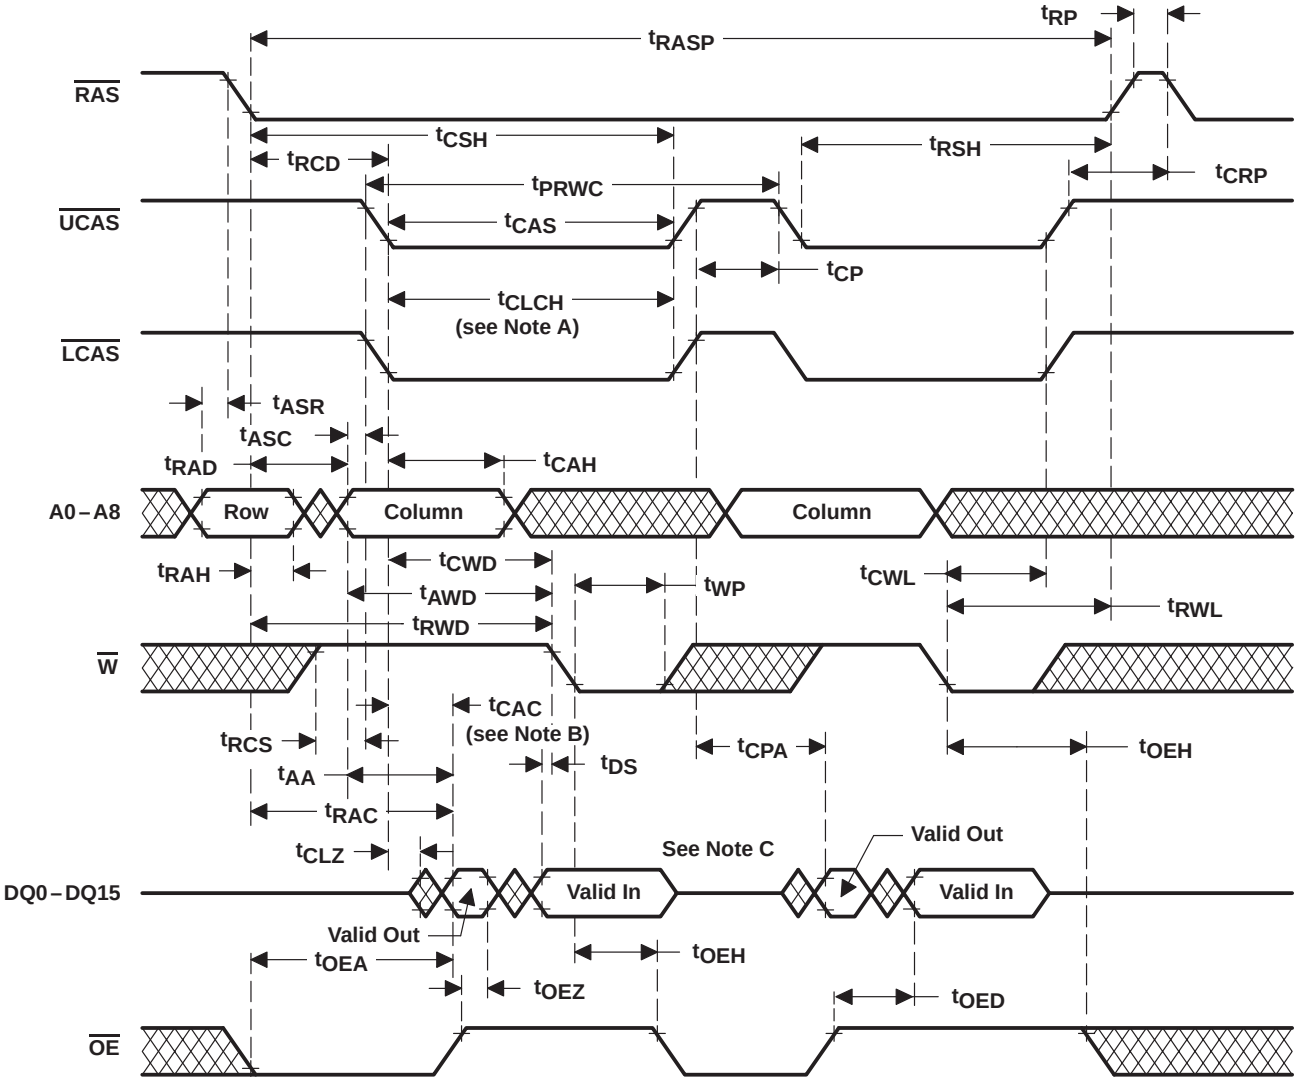
PARAMETER MEASUREMENT INFORMATION



NOTES: A. In order to hold the address latched by the first $\overline{\text{xCAS}}$ going low, the parameter t_{CLCH} must be met.
B. Referenced to $\overline{\text{xCAS}}$ or $\overline{\text{W}}$, whichever occurs last
C. $\overline{\text{xCAS}}$ order is arbitrary.
D. A read cycle or read-modify-write cycle can be mixed with the write cycles as long as the read and read-modify-write timing specifications are not violated.

Figure 7. Enhanced-Page-Mode Write-Cycle Timing

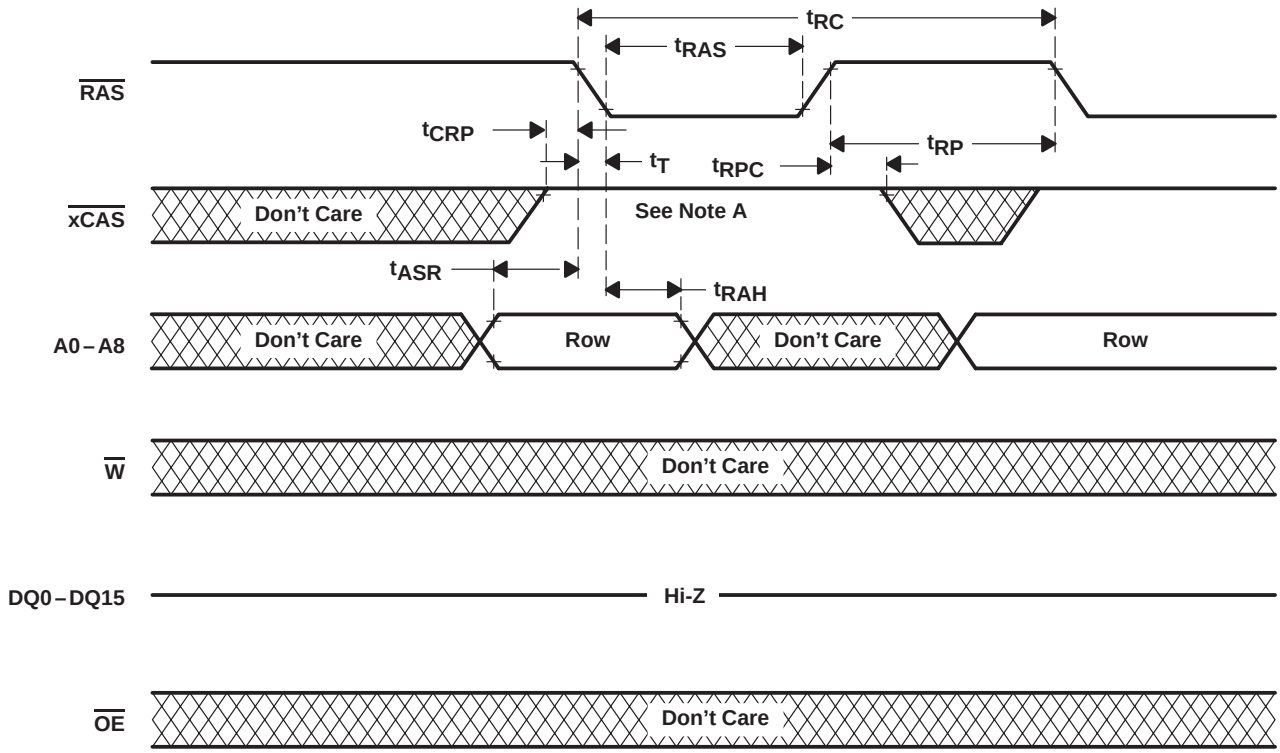
PARAMETER MEASUREMENT INFORMATION



NOTES: A. In order to hold the address latched by the first $\overline{\text{xCAS}}$ going low, the parameter t_{CLCH} must be met.
B. t_{CAC} is measured from $\overline{\text{xCAS}}$ to its corresponding DQx.
C. Output can go from the high-impedance state to an invalid data state prior to the specified access time.
D. $\overline{\text{xCAS}}$ order is arbitrary.
E. A read or write cycle can be intermixed with read-modify-write cycles as long as the read and write cycle timing specifications are not violated.

Figure 8. Enhanced-Page-Mode Read-Modify-Write-Cycle Timing

PARAMETER MEASUREMENT INFORMATION



NOTE A: All $\overline{\text{xCAS}}$ must be high.

Figure 9. $\overline{\text{RAS}}$-Only Refresh Timing

PARAMETER MEASUREMENT INFORMATION

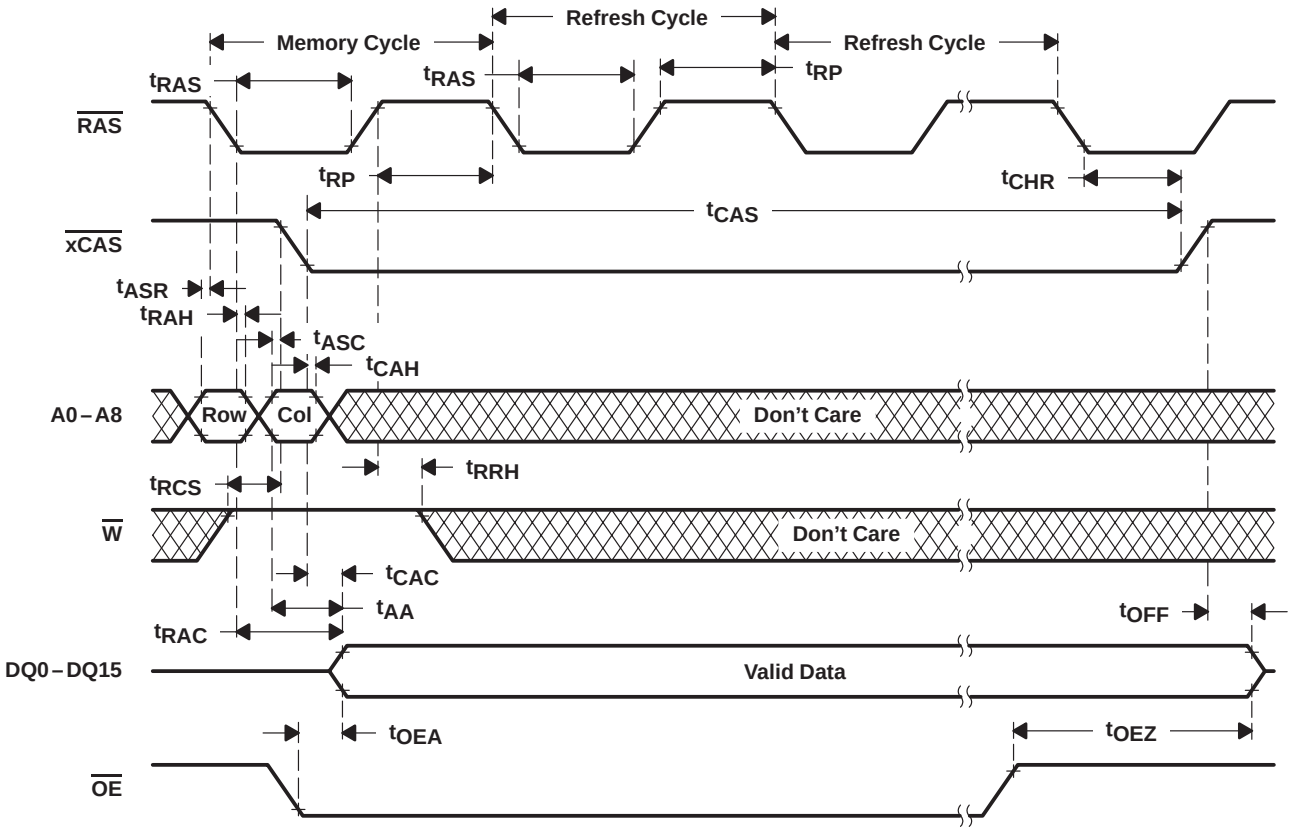


Figure 10. Hidden-Refresh-Cycle Timing

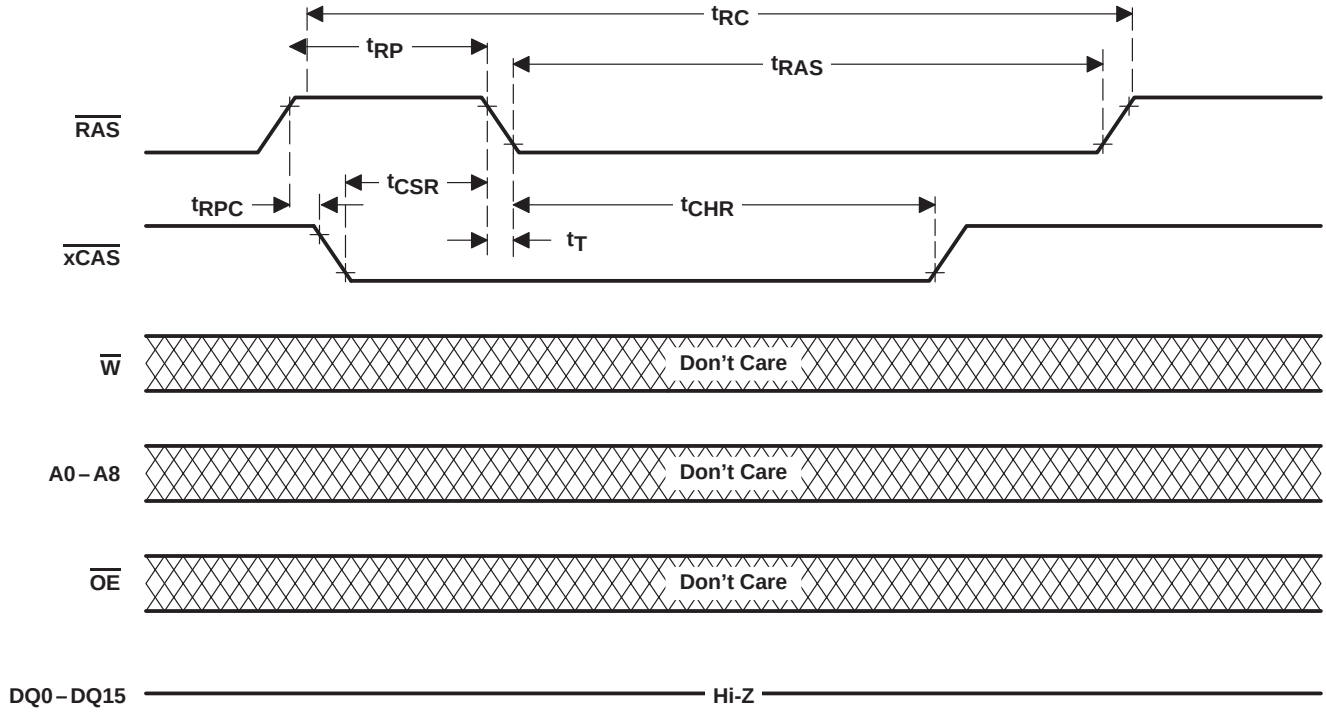
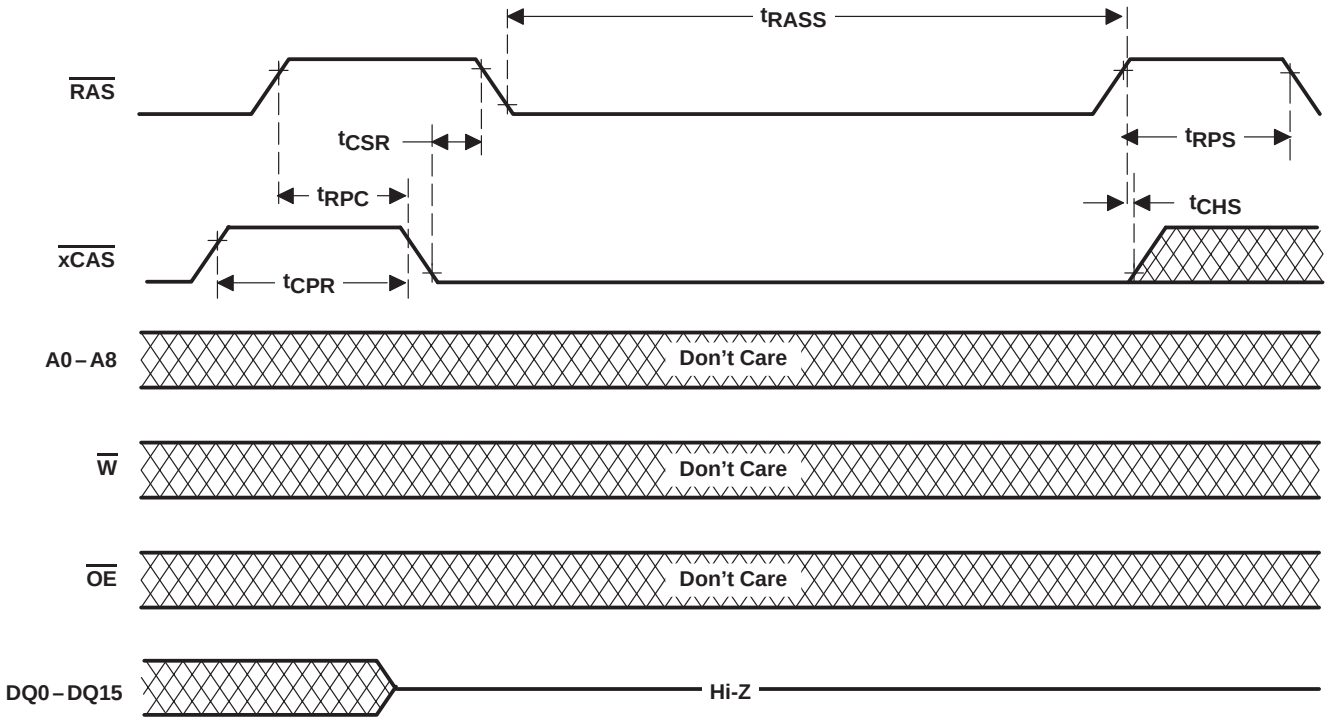
PARAMETER MEASUREMENT INFORMATION



NOTE A: Any $\overline{\text{xCAS}}$ can be used.

Figure 11. Automatic-CBR- Refresh-Cycle Timing

PARAMETER MEASUREMENT INFORMATION



NOTE A: Any xCAS can be used.

IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
