Who Should Read This Book

Who Should Read This Book

This manual is a technical reference for systems programmers and developers for international character support of specific countries. It can also be used by anyone interested in remapping a keyboard or redefining individual keys on the PS/2 or PS/55.

Keyboard Description and Character Reference

What You Should Know

What You Should Know

The reader of this manual should have an understanding of PS/2 and PS/55 equipment and operating system fundamentals.

It is also recommended that you are familiar with AIX Multibyte Character Set (MBCS) capabilities. See the *Related Publications* below.

Keyboard Description and Character Reference

How to Use This Book

How to Use This Book

Part 1, the overview, provides a detailed description of IBM PS/2 and PS/55 keyboards. Part 1 also lists the ASCII international characters represented under the Advanced Interactive Executive (AIX) Operating System.

Part 2, the keyboard tables, contains the keyboard layouts and keyboard tables for the U.S., the Japanese and the European languages.

The Appendixes, includes the following:

The scan codes.

The differences between the 101-, 102- and 106-key keyboards.

Input and output processing examples.

A glossary and index are also included.

PREFACE.3.1 Highlighting

Keyboard Description and Character Reference

Highlighting

Highlighting

Please note the following items regarding hexadecimal notation and highlighting conventions used in this manual:

A hexadecimal value as expressed in this publication is preceded by zero and a lowercase x. For example, the hexadecimal value 'f3' is represented as 0xf3.

Terms highlighted in bold-faced italics (such as ***example***) are specific to Personal System/2 and are included in the glossary.

Terms highlighted in bold type (such as **example**) are specific keys on the keyboard.

Terms or phrases that appear in monospace type (such as **example**) are examples you might see on a display screen or what you must enter into the system to perform a given function.

Keyboard Description and Character Reference Related Publications

Related Publications

For additional information, you may want to refer to the following IBM AIX Operating System publication for the PS/2:

Technical Reference, Volumes 1 and 2, SC23-2032 and SC23-2033, describes the system calls and subroutines a programmer would use to write application programs. This book also provides information about the AIX Operating System file system, special files, miscellaneous files, and the writing of device drivers. Especially appropriate are the sections about: compact, Datastream, Display symbols, HFT and Keyboards.

DOS Merge User's and Administrator's Guide, SC23-2045, provides instructions for using DOS in the AIX environment, including running DOS and AIX programs simultaneously, and running AIX commands from the DOS environment. This books also describes such administrative tasks as installing DOS Merge, adding user accounts, and setting up terminals.

Installing and Customizing the AIX Operating System, SC23-2027, provides step-by-step instructions for installing and customizing the AIX Operating System, including instructions for adding devices to and deleting them from the system and for defining device characteristics. This book also explains how to create, delete, and change AIX and non-AIX minidisks.

AIX Library Guide, Glossary, and Master Index, SC23-2324, describes the publications in the AIX Operating System library and contains a glossary of terms used throughout the library. This book also includes a master index to the contents of each of the publications in the library.

Using the AIX Operating System, SC23-2024, contains information on using AIX Operating System commands, working with the file system, using communication facilities, and developing shell procedures.

AIX Guide to MultiByte Character Set (MBCS) Support, GC23-2333, explains the basic concepts of AIX multibyte chartacter set (MBCS) support and refers to other AIX books that contain more detailed information.

AIX Japanese Language Support User's Guide, N:SC18-0834-0 (written in Japanese) provides programming information for use with the PS/55 system.

About This Chapter

1.1.2 About This Chapter

This chapter describes hardware and software for the keyboards available when the AIX operating system is installed on the IBM Personal System/2. It provides detailed information on the following topics:

"Code Page Overview" in topic 1.1.3 provides an overview of the PS/2 code pages, and shows the general structure of a code page. You will also find an explanation of single shift controls, as well as an explanation of graphic code points. Detailed tables of the structure of and characters contained in Code Pages P0, P1, and P2 are also provided in this chapter.

"Keyboard Overview" in topic 1.1.4 gives you an overview of the PS/2 and PS/55 keyboards, with details about position codes, and illustrations showing the layout and codes for the keyboards: the 101-key (US English) keyboard, the 102-key European, Roman-based languages and the 106-key Japanese keyboard. This chapter also describes the keyboard states for these keyboards.

"Overview of Nonspacing Characters for the PS/2" in topic 1.1.5 gives you a general explanation of nonspacing characters, describes valid and invalid nonspacing character sequences with examples, and provides a list of valid diacritics, and tables of the valid set of characters for each of the diacritics.

Keyboard Description and Character Reference

Code Page Overview

1.1.3 Code Page Overview

AIX Version 1.2.1 supports the processing of characters from European languages and Japanese. European languages are supported by Code Page 850. Japanese is supported by Code Page 932.

Code Page 850 is also called P0. The MBCS string processing routines support only the characters of the P0 segment.

1.1.3.2 P0 Character Graphic Code Points

1.1.3.3 DOS Merge

Keyboard Description and Character Reference

An Overview of Code Page 850

1.1.3.1 An Overview of Code Page 850

Code Page 850 offers Roman-based characters for European Languages. There are 256 distinct characters that it can render on the display.

To designate these characters a code page format has been established. Each segment of the character set consists of 256 possible graphic representations and is called a Page. The first 32 code points in every Code Page are reserved for control characters. These are common to all Code Pages. The control characters do not have graphic representations.

Among the control characters which occupy the first 32 positions of the P0 segment are the **Shift characters**. Unless otherwise indicated, every character is considered a member of the P0 segment. The shift characters signal that the next character is to be interpreted as a member of one of the other Pages of Code Page 850.

The general code page layout is shown below.

The following figure, Figure 1-1 in topic 1.1.3.1, summarizes the layout of Code Pages P0.

The descriptions of characters in Code Pages P0 is given in "Code Page P0" in topic 1.1.3.2.1.

Figure 1-1. Arrangement of Code Page 0

Applications that use Code Page 850 can access the ASCII character set and other extended characters serving the needs of European languages. They can be divided into two categories regarding their level of usage. Applications from all categories can run concurrently on the system.

1. The first category is the 7-bit US ASCII level. This uses only characters represented by code points from 32 to 127 in the P0 segment. This is the left half of P0 only. This level is useful for communication with older versions of UNIX which support only 7-bit ASCII.
2. The second category uses all the code points of the P0 segment of Code Page 850. These single-byte extended characters satisfy most of the needs of European languages.

The doublebyte characters of Code Page 932 can be found in the *IBM Kanji Code Reference*, N: 18-2040-3. This manual is written in Japanese.

Applications that use Code Page 932 can represent data in ASCII

Keyboard Description and Character Reference

An Overview of Code Page 850

characters, Katakana, Hirigana and Kanji.

The level of international characters you use will be determined by:

The capabilities of the input and output devices attached

The version of the operating system you are running

The capabilities of the operating system you are attempting to communicate with (if any)

The capabilities of the application program you are using

The locale you have selected for the session or process

Keyboard Description and Character Reference

P0 Character Graphic Code Points

1.1.3.2 P0 Character Graphic Code Points

The arrangement of the 256 characters is shown in the following pages. The table that follows gives you an explanation of each column and heading in the tables.

Position Number	Number of the character.
Character	Shows that actual character along with a brief description of the character.
Code Page	The hexadecimal (column, row) representation within the code page.
Internal Code	The internal data stream representation of the character.

Subtopics

1.1.3.2.1 Code Page P0

Keyboard Description and Character Reference

Code Page P0

1.1.3.2.1 Code Page P0

The characters in Code Page P0, indicated by the prefix *P0* to the left of their hexadecimal notation, have an internal (data stream) representation of the unprefix code point. For example, the Code Page P0 character *Ñ* (*n Tilde Capital*) has an internal representation of 0xa5.

Position Number	Character		Code Page Code Point	Internal Code

DOS Merge

1.1.3.3 DOS Merge

A display used by the AIX PS/2 DOS Merge program may not show the characters you expect to see for the following reasons:

The characters used by the program running on DOS Merge are not available with that particular display. You may see blanks or substitute characters instead.

The characters used by the program running on DOS Merge may not be available to DOS Merge itself.

See the Code Page chapter of the *Disk Operating System Version 3.30* reference manual for details.

Characters that are not available to DOS Merge itself are translated into AIX operating system characters. See the following table for a list of these characters.

Keyboard Overview

1.1.4 Keyboard Overview

The following keyboards are available on the PS/2 and PS/55.

United States English

Belgian (French Dutch

Canadian French

Danish

Dutch

French

German

Icelandic

Italian

Latin America

Norwegian

Portuguese

Spanish

Swedish (Finnish

Swiss (French and German Variations

United Kingdom English

Japanese

The US English keyboard has 101 keys, the European keyboards have 102 keys and the Japanese keyboard has 106 keys. The differences in the keyboards occur because each language requires a specific set of graphic characters (**character set**) as well as a specific keyboard layout (**graphic key arrangement**) on the keyboard.

The Japanese keyboard is available on the PS/55. Two emulations are possible with this keyboard:

English (ASCII)

Japanese (MBCS)

The US English keyboard mapping is the default keyboard mapping unless a different keyboard, such as the German keyboard, is installed. Refer to *Installing and Customizing the AIX Operating System* for the procedure to install the keyboard specific to your country.

The keyboard position code layouts are given in the following chapter.

Keyboard Description and Character Reference

PS/55

1.1.4.2.1 PS/55

The Japanese PS/55 keyboard is unique in that it operates in either the U.S. English (ASCII) or Japanese (MBCS) modes. This keyboard has 106 keys. For further information about this keyboard, refer to the *AIX Multibyte Character Set Support* manual.

Keyboard Description and Character Reference PS/2

1.1.4.2.2 PS/2

Each key on the PS/2 keyboards has five potential states:

Bas

Shif

Ctrl (control

Alt (alternate

AltGr (alternate graphic)

For the US 101-key keyboard, the AltGr state is identical to the Alt state; therefore, this keyboard gives the appearance of having only four states (Base, Shift, Ctrl, and Alt). In addition, some of these keys are also governed by the **Caps Lock** key or the **Shift Lock** key.

For those keyboards that support **Caps Lock**, **Caps Lock** affects only those keys whose Shift state yields the uppercase character (A, B, C...) of the Base state lower case character (a, b, c...) of the key. For those keyboards that support **Shift Lock**, **Shift Lock** has the same affect as pressing a key while the **Shift** key is pressed.

Refer to Appendix B, "Differences Between the 101-, 102- and 106-Key Keyboards" in topic APPENDIX1.2 for specific differences in the physical keyboard arrangements. Also, the illustrations and tables in Chapter 3, "Belgian (French Dutch) Keyboard Layout and Table" in topic 2.2 through Chapter 19, "US English Keyboard Layout and Table" in topic 2.18 give you details of the keyboard layouts, and tables containing such information as key character assignments, the keyboard definition for each key state, the effect of the **Caps Lock** key, and so on.

Keyboard Description and Character Reference

Overview of Nonspacing Characters for the PS/2

1.1.5 Overview of Nonspacing Characters for the PS/2

Among the 256 graphic characters available in the AIX operating system 13 diacritics are used to construct diacritical (accented) characters. The constructed diacritical characters yield a set of characters over and above those engraved on any specific country-dependent keyboard.

A ***nonspacing character sequence*** is defined as a two-key sequence consisting of one of the thirteen diacritics followed by an alphabetic character.

Subtopics

Keyboard Description and Character Reference

Valid Nonspacing Character Sequences

1.1.5.1 Valid Nonspacing Character Sequences

Valid nonspacing character sequences are restricted to combinations of diacritical characters and alphabetic characters listed in "Accented Characters" in topic 1.1.5.5. When the High Function Terminal Driver (HFT) is running in translate mode, valid nonspacing character sequences are always folded into a single character within code page P0 prior to passing the keyboard input to the application.

A special case exists when the nonspacing character sequence consists of a diacritic followed by a space. In this case, the diacritic character itself is displayed or sent to the application.

Keyboard Description and Character Reference

Invalid Nonspacing Character Sequences

1.1.5.2 Invalid Nonspacing Character Sequences

If the nonspacing character sequence is invalid (does not conform to the description given for valid nonspacing character sequences) the HFT passes the *nonspacing character* to the application followed by the second character of the sequence. Invalid nonspacing character sequences include sequences which:

Start with a nonspacing character but are followed by an alphabetic character such that the resulting diacritical character does not exist in the system,

or

Start with a nonspacing character but are followed by a non-alphabetic character (numeric, control, function key),

or

Start with a nonspacing character but are followed by another nonspacing character.

Keyboard Description and Character Reference

Suspended Nonspacing Character Sequences

1.1.5.3 Suspended Nonspacing Character Sequences

Suspended nonspacing character sequences occur when the active virtual terminal becomes inactive after a nonspacing character sequence is started but before the sequence completes. In the case of a suspended nonspacing character sequence, the HFT continues nonspacing character processing after the virtual terminal reactivates. Nonspacing character processing continues using the rules for valid or invalid nonspacing character sequences depending on which keys are pressed. The following pages give you specific examples of nonspacing character processing.

Keyboard Description and Character Reference

Nonspacing Character Processing Examples

1.1.5.4 Nonspacing Character Processing Examples

A valid nonspacing character sequence causes a single accented character to be returned. A nonspacing character followed by a space character is a valid nonspacing character sequence, and returns the accent itself as a single character. For example:

1st Key Pressed	2nd Key Pressed	Returned
Grave `	e	è e Grave (0x8a) - 1 character
Grave `	Space	` Grave Accent (0x60) - 1 character

An invalid nonspacing character sequence causes the accent character to be returned, followed by the code for the key pressed after the nonspacing key.

1st Key Pressed	2nd Key Pressed	Returned
Grave `	z	` Grave Accent (0x60) - 2 characters z (0x7a)
Acute	PF1	Acute Accent (0xef) - 1 character PF1 (0x1b5b00000171)

An invalid nonspacing character sequence (*nonspacing character - nonspacing character*) causes the first nonspacing character of the sequence to be passed to the application and the next nonspacing character starts a new nonspacing character sequence.

1st Key Pressed	2nd Key Pressed	3rd Key Pressed	Returned
Grave `	Acute	e	` Grave Accent (0x60) é e Acute (0x82) - 2 characters

When the virtual terminal is deactivated (either through user action or by the system) immediately after a nonspacing character is pressed, then reactivation of the virtual terminal causes processing to continue using either the rule for valid nonspacing character sequences or the rule for invalid nonspacing character sequences, as appropriate. Note that the nonspacing character is not forgotten. For example:

1. A user presses the ` (*Grave Accent*) nonspacing character, then presses

Keyboard Description and Character Reference

Nonspacing Character Processing Examples

Window. Nothing is returned, the virtual terminal is deactivated, and another task is done. When the user returns, the virtual terminal is reactivated, the nonspacing character is *remembered*, so that when the user then presses the *e*, an *è* (*e Grave*) character is returned. For example:

1st Key Pressed	2nd Key Pressed	Returned
Grave `	e	è e Grave (0x8a) - 1 character

2. A user presses the */* (*Acute Accent*) nonspacing character, but before the user can complete the sequence a system message is presented. The virtual terminal is deactivated. When the virtual terminal is reactivated, the fact that an */* (*Acute Accent*) nonspacing character was pressed is remembered by the HFT. If the user forgot that he already pressed a nonspacing character, and presses it again, followed by *e*, then two characters */* (*Acute Accent*) and *é* (*e Acute*) are returned. If the user remembers that he had pressed a nonspacing character and immediately on return presses *e*, then one character is returned *é* (*e Acute*). For example:

1st Key Pressed	2nd Key Pressed	3rd Key Pressed	Returned
Acute	Acute	e	Acute Accent (0xef)
			é e Acute (0x82) - 2 characters
Acute	e		é e Acute (0x82) - 1 character

Keyboard Description and Character Reference

Accented Characters

1.1.5.5 Accented Characters

The following tables show the valid set of characters for each of the diacritics that the HFT uses to validate the two-key nonspacing character sequence.

Acute Accented Characters		
	Acute Accent	P0-0xef
	Apostrophe (Acute)	P0-0x27

Chapter 2. About this Section

2.1 Chapter 2. About this Section

Chapters 3 through 19 contain the keyboard layout and keyboard table information for the Personal System/2 and Personal System/55 keyboards.

These tables:

Specify the key assignments to be used on the keyboards.

Indicate the symbol that is engraved on the key.

Give the character sequences that are to be produced by the High Function Terminal Driver (HFT).

Refer to the following listing for the meanings of the column headings:

Key Posn - Keyboard key position.

Shift - The shift state of the position: Base, Shift, Ctrl, Alt, or, on 102-key keyboards, AltGr.

Assignment - The character or control assigned to that key.

Keyboard Definition - Provides information that would have to be sent as part of a keyboard definition set structure. The information here is provided only for the individual key definitions. Within the table, interpret the fields as follows:

nnn - One-byte key position number being defined.

s - Shift state being defined. Bits 1-3 should be set to:

b (base) - No **Shift** key is pressed.

s (shift) - Either left or right **Shift** key is pressed.

c (control) - **Ctrl** key is pressed.

a (alt) - **Alt** key is pressed.

g (alt gr) - **AltGr** key is pressed. (Only on 102-key keyboards).

t - Type of definition. Coded in bits 4-7 of the byte and can take the following forms:

c - Escaping character definition, followed by a 1-byte code set identifier and a 1-byte code point specification. The code set identifiers are:

< for Code Page P0

= for Code Page P1

> for Code Page P2

This identifier is followed by a 1-byte code point identifier, given in the table as a decimal number.

f - Function specification, followed by a 2-byte (16-bit) function identifier, which is specified in the table as a hexadecimal value.

Keyboard Description and Character Reference

Chapter 2. About this Section

s - String specification, followed by a 1-byte (8-bit) code page identifier, a 1-byte (8-bit) string length and the 1-byte code point identifiers within the specified code page. No string specifications are included in the default keyboard layouts.

d - Dead character definition, followed by a 1-byte (8-bit) code set identifier and a 1-byte code point specification. The code set identifiers are as described for character definition. This is followed by a 1-byte code point identifier, given in the table as a decimal number.

Returned String - Specifies the data that is returned to the program that is reading the keyboard.

Notes - Specifies additional information. Entries in this column include:

CL - This key is affected by **Caps Lock**.

DK - This key is a dead character on this key state.

P1 - This key is a character from Code Page P1.

P2 - This key is a character from Code Page P2.

The **Alt** key, followed by one or more numbered keys on the numeric pad, will return a single character which has the value entered on the numeric pad. The value accumulates while the Alt key is held down and returns when that key is released. Only escaping character codes and single-byte controls are produced by this method.

Appendix A. Keyboard Scan Codes

APPENDIX1.1 Appendix A. Keyboard Scan Codes

This appendix contains the keyboard scan codes for both Personal System/2 international character keyboards.

See the hardware technical reference manual that applies to your particular system model for variations on this table.

Each key on the keyboard is assigned a unique 8-bit scan code which is sent when the key is pressed. Refer to the keyboard layouts in "101-Key US English Keyboard" in topic 1.1.4.1.1, "102-Key Keyboard" in topic 1.1.4.1.2, and to the keyboard position codes in Chapter 3, "Belgian (French Dutch) Keyboard Layout and Table" in topic 2.2 through Chapter 19, "US English Keyboard Layout and Table" in topic 2.18.

See the following page for the key position and scan code table.

Key Positions and Their Scan Codes for 101- and 102- Keyboards					
1 - 0x0e	23 - 0x3c	45 - N/A	67 - N/A	89 - 0x6a	111 - N/A

Appendix B. Differences Between the 101-, 102- and 106-Key Keyboards

APPENDIX1.2 Appendix B. Differences Between the 101-, 102- and 106-Key Keyboards

This appendix details the differences between the physical keyboard layouts for the 101-, 102- and 106-key keyboards.

The differences include the following:

The US 101-key keyboard has a double wide **Carrier Return (Enter)** key (position codes 42 and 43) and generates position code 43 when pressed.

The US 101-key keyboard left **Shift** key (position codes 44 and 45) is twice as wide as the 102-key keyboard left **Shift** key and generates position code 44 when pressed.

The 102-key keyboard **Carrier Return (Enter)** key (position codes 29 and 43) is twice as high as the US **Carrier Return** key, and generates position code 43 when pressed.

The 102-key keyboard left **Shift** key (position code 44)

The 106-key keyboard operates either in U.S. English (PS/2 Mode) or Japanese (MBCS). For more specific information regarding this 106-key keyboard, see the *AIX MBCS Guide, Using*, and the *AIX Japanese User Guide*.

Position code 42, which is suppressed on the US 101-key keyboard, is available for assignment and is labeled on the 102-key keyboard.

Position code 29, which is available in the US 101-key keyboard is suppressed on the 102-key keyboard.

For some countries, besides having an additional key in the physical keyboard arrangement, **nonspacing characters** are also defined. These nonspacing characters are used in a two-key sequence to construct accented characters. The nonspacing characters, called **diacritics**, are national characters, such as acute accent, grave accent, and circumflex accent.

APPENDIX1.3.2 Examples of Output Processing

Keyboard Description and Character Reference

Input Processing Examples

APPENDIX1.3.1 Input Processing Examples

The headings in the input examples have the following meanings:

XLATE(P0) - Keyboard translation table entry for Code Page P0.

XLATE(P1) - Keyboard translation table entry for Code Page P1.

XLATE(P2) - Keyboard translation table entry for Code Page P2.

KEYPAD - Entry made from the numeric keypad (Alt-Num).

KEYPAD/CTL - Entry made from the numeric keypad or Ctrl state.

RETURNED - Value(s) returned to the application.

ECHOED - Character echoed to the display.

Subtopics

APPENDIX1.3.1.1 Examples of Default Input Processing

APPENDIX1.3.1.2 Examples of Nondefault Input Processing

Keyboard Description and Character Reference

Examples of Default Input Processing

APPENDIX1.3.1.1 Examples of Default Input Processing

Assume the following default conditions for the input examples:

Default keyboard translation table entries

G0 is the active display character set

G0 is set to Code Page P0

Example 1.1. The keyboard translate table contains 0x41 for Code Page P0. When the key corresponding to this keyboard translation table entry is pressed, the HFT sends 0x41 to the application and causes the A (*a Capital*) to be echoed to the display.

XLATE(P0)	RETURNED	ECHOED
0x41	0x41	A a Capital

Example 1.2. The keyboard translate table contains 0x80 for Code Page P0. When the key corresponding to this keyboard translation table entry is pressed, the HFT sends 0x80 to the application and causes the Ç (*c Cedilla Capital*) to be echoed to the display.

XLATE(P0)	RETURNED	ECHOED
0x80	0x80	Ç c Cedilla Capital

Example 1.3. The keyboard translate table contains 0x41 for Code Page P1. When the key corresponding to this keyboard translation table entry is pressed, the HFT sends 0x1fc1 to the application and causes the ß (*s Sharp*) to be echoed to the display.

XLATE(P1)	RETURNED	ECHOED
0x41	0x1fc1	ß s Sharp

Example 1.4. The keyboard translate table contains 0x80 for Code Page P1. When the key corresponding to this keyboard translation table entry is pressed, the HFT sends 0x1e80 to the application and causes the s (*s Caron Small*) to be echoed to the display.

XLATE(P1)	RETURNED	ECHOED
0x80	0x1e80	s s Caron Small

Example 1.5. The keyboard translate table contains 0x41 for Code Page P2. When the key corresponding to this keyboard translation table entry is pressed, the HFT sends 0x1dc1 to the application and causes the &nu. (*Nu Small*) to be echoed to the display.

Keyboard Description and Character Reference

Examples of Default Input Processing

XLATE(P2)	RETURNED	ECHOED
0x41	0x1dc1	&nu. Nu Small

Example 1.6. The keyboard translate table contains 0x80 for Code Page P2. When the key corresponding to this keyboard translation table entry is pressed, the HFT sends 0x1c80 to the application and causes the *Bottom Side Middle - Double Vertical (BSM - DV)* to be echoed to the display.

XLATE(P2)	RETURNED	ECHOED
0x80	0x1c80	BSM - DV

Note: Characters not assigned to any one key on the keyboard can be input from the numeric keypad or the Ctrl state. To input a character using these methods, enter the keys corresponding to the **Internal Code** for the character as found in Figure 1-1 in topic 1.1.3.1. The hexadecimal value shown in the **Internal Code** column must be converted and keyed in as a decimal value when using the numeric keypad.

Example 1.7. The value 0x41 is entered from the numeric keypad. Since this value is not preceded by a single shift control, the 0x41 is sent to the application and the active graphic character set (P0) is used to display the character.

KEYPAD	RETURNED	ECHOED
0x41	0x41	A a Capital

Example 1.8. The value 0x1f (SS1) is entered from the numeric keypad or the Ctrl state. Then the value 0xc1 is entered from the numeric keypad. The 0x41 index into the Code Page P1 display symbols is used to display the character.

KEYPAD/CTL	RETURNED	ECHOED	ECHOED
0x1f	0xc1	0x1fc1	ß s Sharp

Example 1.9. The value 0x1e (SS2) is entered from the numeric keypad or the Ctrl state. Then the value 0xc1 is entered from the numeric keypad. The 0xc1 index into the Code Page P1 display symbols is used to display the character.

KEYPAD/CTL	KEYPAD	RETURNED	ECHOED
0x1e	0xc1	0x1ec1	ij ij Ligature Small

Example 1.10. The value 0x1d (SS3) is entered from the numeric keypad or the Ctrl state. Then the value 0xa0 is entered from the numeric keypad.

Keyboard Description and Character Reference

Examples of Default Input Processing

The 0x20 index into the Code Page P2 display symbols is used to display the character.

KEYPAD/CTL	KEYPAD	RETURNED	ECHOED
0x1d	0xa0	0x1da0	&increase. Increase

Example 1.11. The value 0x1c (SS4) is entered from the numeric keypad or the Ctrl state. Then the value 0xa0 is entered from the numeric keypad. The 0xa0 index into the Code Page P2 display symbols is used to display the character.

KEYPAD/CTL	KEYPAD	RETURNED	ECHOED
0x1c	0xa0	0x1ca0	&sqrt. Radical

Keyboard Description and Character Reference

Examples of Nondefault Input Processing

APPENDIX1.3.1.2 Examples of Nondefault Input Processing

For the following input examples, assume these conditions:

Default keyboard translation table entries

Set Graphic Set G1 to P1 followed by a shift out control

G1 is the active display character set

G1 is set to P1

Please note that the character echoed for unprefixed code points is different than the default case. However, the character echoed for prefixed code points is the same as in the default case. A few examples of the characters that are the same as the default cases are included in the examples below.

Example 2.1. The keyboard translate table contains 0x41 for Code Page P0. When the key corresponding to this keyboard translation table entry is pressed, the HFT sends 0x41 to the application and causes the β (*s Sharp*) to be echoed to the display because the active display set, G1, is set to P1.

XLATE(P0)	KEYPAD	RETURNED
0x41	0x41	β s Sharp

Example 2.2. The keyboard translate table contains 0x80 for Code Page P0. When the key corresponding to this keyboard translation table entry is pressed, the HFT sends 0x80 to the application and causes the *s* (*s Caron Small*) to be echoed to the display because the active display set, G1, is set to P1.

XLATE(P0)	KEYPAD	RETURNED
0x80	0x80	s s Caron Small

Example 2.3. The keyboard translate table contains 0x41 for Code Page P1. When the key corresponding to this keyboard translation table entry is pressed, the HFT sends 0x1fc1 to the application and causes the β (*s Sharp*) to be echoed to the display because the active display set, G1, is set to P1.

XLATE(P1)	KEYPAD	RETURNED
0x41	0x1fc1	β s Sharp

The echoing of this symbol bypasses the active graphic display set and is not affected by the SG0/SG1 and shift in/shift out controls.

Example 2.4. The keyboard translate table contains 0x80 for Code Page P1. When the key corresponding to this keyboard translation table entry is pressed, the HFT sends 0x1e80 to the application and causes the *s* (*s Caron*

Keyboard Description and Character Reference

Examples of Nondefault Input Processing

Small) to be echoed to the display.

XLATE(P1)	KEYPAD	RETURNED
0x80	0x1e80	s s Caron Small

The echoing of this symbol bypasses the active graphic display set and is not affected by the SG0/SG1 and shift in/shift out controls.

Keyboard Description and Character Reference

Examples of Output Processing

APPENDIX1.3.2 Examples of Output Processing

The headings in the output examples have the following meaning:

OUTPUT__BUFFER - Character(s) in application output buffer.

DISPLAY - Character shown on the display.

Subtopics

APPENDIX1.3.2.1 Examples of Default Output Processing

APPENDIX1.3.2.2 Examples of Output Nondefault Processing

Keyboard Description and Character Reference

Examples of Default Output Processing

APPENDIX1.3.2.1 Examples of Default Output Processing

For the following output examples, assume the default conditions:

G0 is the active display character set

G0 is set to P0

Example 3.1. The unprefixed code point 0x41 is sent in the application display output data stream. Since G0 is the active display character set and is set to P0, A (*a Capital*) is displayed.

OUTPUT_BUFFER	DISPLAY
0x41	A a Capital

Example 3.2. The unprefixed code point 0x80 is sent in the application display output data stream. Since G0 is the active display character set and is set to P0, Ç (*c Cedilla Capital*) is displayed.

OUTPUT_BUFFER	DISPLAY
0x80	Ç c Cedilla Capital

Example 3.3. The SS1 prefixed code point 0xc1 is sent in the application display output data stream. This is a request to display a character from the left half of code page P1. The high-order bit of the 0xc1 is reset to produce 0x41. The character at the 0x41 offset into Code Page P1 is displayed.

OUTPUT_BUFFER	DISPLAY
0x1fc1	ß s Sharp

Example 3.4. The SS2 prefixed code point 0x80 is sent in the application display output data stream. This is a request to display a character from the right half of Code Page P1. The high-order bit of this byte is not reset, 0x80 is used as an offset into Code Page P1 to select the character to be displayed.

OUTPUT_BUFFER	DISPLAY
0x1e80	s s Caron Small

Example 3.5. The SS3 prefixed code point 0xc1 is sent in the application display output data stream. This is a request to display a character from the left half of Code Page P2. The high-order bit of the 0xc1 is reset to produce 0x41. The character at the 0x41 offset into Code Page P2 is displayed.

OUTPUT_BUFFER	DISPLAY
---------------	---------

Keyboard Description and Character Reference

Examples of Default Output Processing

OUTPUT_BUFFER	DISPLAY
0x1dc1	&nu. Nu Small

Example 3.6. The SS4 prefixed code point 0x80 is sent in the application display output data stream. This is a request to display a character from the right half of Code Page P2. The high-order bit of this byte is not reset, 0x80 is used as an offset into Code Page P2 to select the character to be displayed.

OUTPUT_BUFFER	DISPLAY
0x1c80	BSM -DV

Example 3.7. The single shift control, SS1, followed by 0x41, a code point in the range 0x00 - 0x7f (high-order bit reset). This is an invalid sequence. In this case the SS1 is ignored and the following code point is processed as an unprefixed code point. Since G0 is the active display character set and is set to P0, A (*a Capital*) is displayed.

OUTPUT_BUFFER	DISPLAY
0x1f41	A a Uppercase

Example 3.8. The single shift control, SS2, followed by 0x41, a code point in the range 0x00 - 0x7f (high-order bit reset). This is an invalid sequence. In this case the SS2 is ignored and the following code point is processed as an unprefixed code point. Since G0 is the active display character set and is set to P0, A (*a Capital*) is displayed.

OUTPUT_BUFFER	DISPLAY
0x1e41	A a Uppercase

Example 3.9. The single shift control, SS3, followed by 0x41, a code point in the range 0x00 - 0x7f (high-order bit reset). This is an invalid sequence. In this case the SS3 is ignored and the following code point is processed as an unprefixed code point. Since G0 is the active display character set and is set to P0, A (*a Capital*) is displayed.

OUTPUT_BUFFER	DISPLAY
0x1d41	A a Uppercase

Example 3.10. The single shift control, SS4, followed by 0x41, a code point in the range 0x00 - 0x7f (high-order bit reset). This is an invalid sequence. In this case the SS4 is ignored and the following code point is processed as an unprefixed code point. Since G0 is the active display character set and is set to P0, A (*a Capital*) is displayed.

OUTPUT_BUFFER	DISPLAY

Examples of Output Nondefault Processing

APPENDIX 1.3.2.2 Examples of Output Nondefault Processing

For the following output examples, assume these conditions:

Set Graphic Set G1 to P1 followed by a shift out contro

G1 is the active display character se

G1 is set to P1

Please note that the character displayed for unprefixed code points is different than the default case. However, the character displayed for prefixed code points is the same as in the default case. A few examples of the characters that are the same as the default cases are included below.

Example 4.1. The unprefixed code point 0x41 is sent in the application display output data stream. Since G1 is the active display character set and is set to P1, ß (*s Sharp*) is displayed.

OUTPUT_BUFFER	DISPLAY
0x41	ß s Sharp

Example 4.2. The unprefixed code point 0x80 is sent in the application display output data stream. Since G1 is the active display character set and is set to P1, s (*s Caron Small*) is displayed.

OUTPUT_BUFFER	DISPLAY
0x80	s s Caron Small

Example 4.3. The SS1 prefixed code point 0xc1 is sent in the application display output data stream. This is a request to display a character from the left half of Code Page P1. The high-order bit of the 0xc1 is reset to produce 0x41. The character at the 0x41 offset into Code Page P1 is displayed.

OUTPUT_BUFFER	DISPLAY
0x1fc1	ß s Sharp

Example 4.4. The SS2 prefixed code point 0x80 is sent in the application display output data stream. This is a request to display a character from the right half of Code Page P1. The high-order bit of this byte is not reset, 0x80 is used as an offset into Code Page P1 to select the character to be displayed.

OUTPUT_BUFFER	DISPLAY
0x1e80	s s Caron Small

Keyboard Description and Character Reference

Examples of Output Nondefault Processing

Example 4.5. The SS3 prefixed code point 0xc1 is sent in the application display output data stream. This is a request to display a character from the left half of Code Page P2. The high-order bit of the 0xc1 is reset to produce 0x41. The character at the 0x41 offset into Code Page P2 is displayed.

OUTPUT_BUFFER	DISPLAY
0x1dc1	&nu. Nu Small

Example 4.6. The SS4 prefixed code point 0x80 is sent in the application display output data stream. This is a request to display a character from the right half of Code Page P2. The high-order bit of this byte is not reset, 0x80 is used as an offset into Code Page P2 to select the character to be displayed.

OUTPUT_BUFFER	DISPLAY
0x1c80	BSM - DV

Example 4.7. The single shift control, SS1, followed by 0x41, a code point in the range 0x00 - 0x7f (high-order bit reset). This is an invalid sequence. In this case, the SS1 is ignored and the following code point is processed as an unprefixed code point. Since G1 is the active display character set and is set to P1, ß (*s Sharp*) is displayed.

OUTPUT_BUFFER	DISPLAY
0x1f41	ß s Sharp

Example 4.8. The single shift control, SS2, followed by 0x41, a code point in the range 0x00 - 0x7f (high-order bit reset). This is an invalid sequence. In this case, the SS2 is ignored and the following code point is processed as an unprefixed code point. Since G1 is the active display character set and is set to P1, ß (*s Sharp*) is displayed.

OUTPUT_BUFFER	DISPLAY
0x1e41	ß s Sharp

Example 4.9. The single shift control, SS3, followed by 0x41, a code point in the range 0x00 - 0x7f (high-order bit reset). This is an invalid sequence. In this case, the SS3 is ignored and the following code point is processed as an unprefixed code point. Since G1 is the active display character set and is set to P1, ß (*s Sharp*) is displayed.

OUTPUT_BUFFER	DISPLAY
0x1d41	ß s Sharp

Keyboard Description and Character Reference

Examples of Output Nondefault Processing

Example 4.10. The single shift control, SS4, followed by 0x41, a code point in the range 0x00 - 0x7f (high-order bit reset). This is an invalid sequence. In this case, the SS4 is ignored and the following code point is processed as an unprefixed code point. Since G1 is the active display character set and is set to P1, ß (*s Sharp*) is displayed.

0x1c41	ß s Sharp

Keyboard Description and Character Reference Glossary

GLOSSARY Glossary

alphanumeric. Pertaining to a set of characters, a through z.

alphameric. Consisting of letters, numbers and often other symbols, such as punctuation marks and mathematical symbols.

American National Standard Code for Information Interchange (ASCII). The code developed by ANSI for information interchange among data processing systems, data communications systems, and associated equipment. The ASCII character set consists of 7-bit control characters and symbolic characters.

alt keyboard state. See *alternate keyboard state*.

alt gr keyboard state. See *alternate graphic keyboard state*.

alternate keyboard state. A state of the keyboard obtained by pressing the Alt key in combination with another key.

alternate graphic keyboard state. A state of the keyboard obtained by pressing the AltGr key in combination with another key.

application. (1) A particular task, such as inventory control or accounts receivable. (2) A program or group of programs that apply to a particular business area, such as the Inventory Control or the Accounts Receivable application.

ASCII. See *American National Standard Code for Information Interchange*.

base keyboard state. Default state of the keyboard characterized by no shift keys being pressed.

binary. (1) Pertaining to a system of numbers to the base two; the binary digits are 0 and 1. (2) Involving a choice of two conditions, such as on-off or yes-no.

bit. Either of the binary digits 0 or 1 used in computers to store information. See also *byte*.

bit patterns. Combination of bits used to form data stream characters.

block. (1) A group of records that is recorded or processed as a unit. Same as *physical record*. (2) In data communications, a group of records that is recorded, processed, or sent as a unit. (3) A block is 512 bytes long.

Keyboard Description and Character Reference Glossary

- byte.** The amount of storage required to represent one character; a byte is 8 bits.
- character.** A letter, digit, or other symbol.
- character key.** A keyboard key that allows the user to enter the character shown on the key. Compare with *function keys*.
- character set.** A group of characters used for a specific reason; for example, the set of characters a printer can print or a keyboard can support.
- character string.** A sequence of consecutive characters.
- C language.** A general-purpose programming language that is the primary language of the AIX operating system.
- code.** A system of bit patterns to which specific graphic or control meanings have been assigned.
- code page.** (1) An assignment of graphic characters and control function meanings to all the code points of a particular code. For example, an 8-bit code has 256 code points, each of which must be assigned some meaning. A 7-bit code has 128 code points. The code page for a 7-bit code will assign one graphic character (a glyph) or one control function to each of the code elements from 0 to 127. (2) A specification of code points for each character in a set. Within a given code page, each code point can have only one specific meaning.
- code page switching.** To change to a different code page.
- code point.** One of the bit patterns specified by a code.
- control block.** A storage area used by a program to hold control information.
- control character.** A non-printing character that performs formatting functions in a text file.
- ctrl keyboard state.** See *control keyboard state*.
- control keyboard state.** A state of the keyboard obtained by pressing the Ctrl key in combination with another key.
- cursor.** (1) A movable symbol (such as an underline) on a display, used to

Keyboard Description and Character Reference Glossary

indicate to the operator where the next typed character will be placed or where the next action will be directed. In Usability Services, the cursor is called a text cursor. (2) A marker that indicates the current data access location within a file. See also *pointing cursor*.

customize. To describe (to the system) the devices, programs, users, and user defaults for a particular data processing system.

data stream. All information (data and control information) transmitted over a data link.

decimal. Pertaining to a system of numbers to the base ten; decimal digits range from 0 to 9.

default. A value that is used when no alternative is specified by the operator.

default value. A value stored in the system that is used when no other value is specified.

enable. To make a function or system able to perform.

encode. To convert data by use of a code in such a manner that reconversion to the original form is possible.

encoding scheme. Method or algorithm used to encode data.

escape character. A character that changes the meaning of the characters that follow. For example the back slash character, used to indicate to the shell that the next character is not intended to have the special meaning normally assigned to it by the shell.

ETX (End of Text - 0x03). A communication grouping control character which is used to terminate a sequence of characters started with STX and transmitted as an entity.

FF (form feed - 0c). A formatting control character that moves the active position to the starting margin on the first predetermined printing line on the next form or page.

font. A family or assortment of characters of a given size and style.

function. A synonym for procedure. The C language treats a function as a data type that contains executable code and returns a single value to the calling function.

Keyboard Description and Character Reference Glossary

function keys. Keys that request action but do not display or print characters. Included are the keys that normally produce a printed character, but when used with a code key produce a function instead. Compare with *character key*.

graphic character. (1) A character that can be displayed or printed.
(2) A graphic symbol, such as a numeric, alphabetic, or special character.

graphic character set. A set of graphic characters, treated as an entity.

hardware. The equipment as opposed to the programming, of a system.

hex. See *hexadecimal*.

hexadecimal. Pertaining to a system of numbers to the base sixteen; hexadecimal digits range from 0 (zero) through 9 (nine) and A (ten) through F (fifteen).

high-order. Most significant; leftmost. For example, bit 0 in a register.

High Function Terminal (HFT). An AIX operating system device driver which implements a virtual terminal concept on the PS/2 display device. This device driver accepts input from one of the fifteen country keyboards and allows display of up to 517 character symbols.

HFT. See *High Function Terminal*.

HT (Horizontal Tab - 0x09). A formatting control character that moves the active position horizontally to the next tab stop setting.

index. (1) A table containing the key value and location of each record in an indexed file. (2) A computer storage position or register, whose contents identify a particular element in a set of elements.

infinity. A name for the upper boundary of a set of numbers.

input. Data to be processed.

input device. Physical devices used to provide data to the computer.

input mode. An open mode in which records can be read from the file.

input stream. The sequence of operation control statements and data given to the system from an input device.

Keyboard Description and Character Reference Glossary

input/output (I/O). Pertaining to either input, output, or both.

key pad. A physical grouping of keys on a keyboard (for example, numeric key pad, and cursor key pad).

keyboard. An input device consisting of various keys allowing the user to input data, control cursor and pointer locations, and to control the user/workstation dialog.

lowercase character. Those graphic characters of a primary set which can be input from a keyboard without use of any shift key (including the small letters).

low-order. Least significant; rightmost. For example, in a 32 bit register (0-31), bit 31 is the low-order bit.

MultiByte Character Set (MBCS). A method of encoding a set of glyphs (written symbols) so that the coded set will be large enough to encompass all of the world's written languages. The MBCS system handles character sets which range in encoding size from one to four bytes.

nonspacing character sequence. A two-key sequence consisting of one diacritic followed by an alphabetic character.

NUL (Null - 0x00). A synchronization control character, with an all-zeros bit pattern, which may serve to accomplish time and media fill.

null. Having no value, containing nothing.

null character (NUL). The character 0x00, used to represent the absence of a printed or displayed character.

non-escaping key. On a typewriter and in word processing, a key that allows a character to be typed without the imprint position being changed.

numeric. Pertaining to any of the digits 0 through 9.

operating system. Software that controls the running of programs; in addition, an operating system may provide services such as resource allocation, scheduling, input/output control, and data management.

output. The result of processing data.

output devices. Physical devices used by a computer to present data to a

Keyboard Description and Character Reference Glossary

user.

output mode. An open mode in which records can be written to the file.

output stream. Messages and other output data, displayed on output devices by an operating system or a processing program.

pipe. To direct the data from one process to another process.

program. A document containing a set of instructions, conforming to a particular programming language syntax. Programs perform processes and are represented by process objects when active (when they are executed).

shift keyboard state. A state of the keyboard obtained by pressing the Shift key in combination with another key.

software. Programs.

SOH (Start of Heading - 0x01). A communication grouping control character which is used at the beginning of a sequence of characters which constitute a machine-sensible address or routing information. Such a sequence is referred to as the heading.

STX (Start of Text - 0x02). A communication grouping control character which is used at the beginning of a sequence of characters which constitute a machine-sensible address or routing information. Such a sequence is referred to as the text. STX may be used to terminate a sequence of characters started by SOH.

system. The computer and its associated devices and programs.

text. A type of data consisting of a set of linguistic characters (alphabet, numbers, symbols) and formatting controls.

uppercase character. Those graphic characters (including capital letters) of a primary set which can be input from a keyboard by using the normal shift key.

utility. (1) A computer program in general support of the processes of a computer; for instance, a diagnostic program, a trace program, a sort program. (2) A program designed to perform an everyday task such as copying data from one storage device to another.

valid. (1) Allowed. (2) True, in conforming to an appropriate standard or authority.

Keyboard Description and Character Reference

Glossary

VT (Vertical Tab - 0x0b). A formatting control character that moves the active position vertically to the next in a series of predetermined lines.
